BOEING

WARNING
DO NOT USE THIS MANUAL OR ANY OF THE RELATED MATERIALS IN ANY WAY IN THE OPERATION, USE OR MAINTENANCE OF ANY AIRCRAFT. THESE MATERIALS HAVE BEEN PREPARED AND ARE PROVIDED SOLELY TO GIVE GUIDANCE ON THE LAYOUT AND STRUCTURE OF A TYPICAL AIRCRAFT MANUAL. THESE MATERIALS HAVE NOT BEEN APPROVED BY ANY AVIATION ADMINISTRATION FOR USE ON ANY AIRCRAFT AND SHOULD NEVER BE SO USED UNDER ANY CIRCUMSTANCES. FAILURE TO FOLLOW THIS WARNING COULD LEAD TO SERIOUS INJURY OR DEATH.

Flight Crew Operations Manual

The Boeing Company

Document Number D6-27370-TBC
Revision Number: 54
Revision Date: March 30, 2024

Intentionally
Blank

Volume 1

Volume 2

Preface — Chapter 0
Model Identification — Section 1

General

The aircraft listed in the table below are covered in the Flight Crew Operations Manual (FCOM). The numbers are used to distinguish data peculiar to one or more, but not all of the airplanes. Where data applies to all airplanes listed, no reference is made to individual airplane numbers. Configuration data reflects the airplane as delivered configuration and is updated for service bulletin incorporations in conformance with the policy stated in the introduction section of this chapter.

Registry number is supplied by the operator as provided by the national regulatory agency. Serial and tabulation numbers are supplied by Boeing.

Registry number(s) reflect the most current information supplied by the operator to the Boeing Company through the SR process and 60 days prior to the subject revision date. Registry numbers received after that date will be incorporated at the next scheduled revision. If a registry number is not provided the FCOM will default to serial number.

Registry Number	Serial Number	Tabulation Number
YX600	YX600	YX600
YX700	YX700	YX700
YX800	YX800	YX800
YX802	YX802	YX802
YX900	YX900	YX900
YX910	YX910	YX910

Intentionally
Blank

General

This Flight Crew Operations Manual (FCOM) has been prepared by The Boeing Commercial Airplanes, Commercial Aviation Services organization. The purpose of this manual is to:

- provide the necessary operating limitations, procedures, performance, and systems information the flight crew needs to safely and efficiently operate the 737 airplane during all anticipated airline operations
- serve as a comprehensive reference for use during transition training for the 737 airplane
- serve as a review guide for use in recurrent training and proficiency checks
- provide necessary operational data from the FAA approved airplane flight manual (AFM) to ensure that legal requirements are satisfied
- establish standardized procedures and practices to enhance Boeing operational philosophy and policy.

This manual is prepared for the owner/operator named on the title page specifically for the airplanes listed in the "Model Identification" section. It contains operational procedures and information, which apply only to these airplanes. The manual covers the Boeing delivered configuration of these airplanes. Changes to the delivered configuration are incorporated when covered by contractual revision agreements between the owner/operator and The Boeing Company

This manual is not suitable for use for any airplanes not listed in the "Model Identification" section. Further, it may not be suitable for airplanes that have been transferred to other owners/operators.

Owners/operators are solely responsible for ensuring the operational documentation they are using is complete and matches the current configuration of the listed airplanes. This includes the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in the operational procedures and information contained in this manual.

This manual is structured in a two volume format with a quick reference handbook (QRH). Volume 1 includes operational limitations, normal procedures, supplementary procedures, dispatch performance data, and inflight performance data. Volume 2 contains systems information. The QRH contains all checklists necessary for normal and non-normal procedures as well as inflight performance data.

The manual is periodically revised to incorporate pertinent procedural and systems information. Items of a more critical nature will be incorporated in operational bulletins and distributed in a timely manner. In all cases, such revisions and changes must remain compatible with the approved AFM with which the operator must comply. In the event of conflict with the AFM, the AFM shall supersede.

This manual is written under the assumption that the user has had previous multi–engine jet aircraft experience and is familiar with basic jet airplane systems and basic pilot techniques common to airplanes of this type. Therefore, the FCOM does not contain basic flight information that is considered prerequisite training.

Please send all correspondence regarding content or use of this manual including bulletin status, to the 737 Manager, Flight Technical Data through the Service Requests (SR) application on the MyBoeingFleet home page.

Organization

The FCOM is organized in the following manner.

Volume 1

- Preface – contains general information regarding the manual's purpose, structure, and content. It also contains lists of abbreviations, a record of revisions, bulletins, and a list of effective pages.
- Limitations and Normal Procedures chapters cover operational limitations and normal procedures. All operating procedures are based on a thorough analysis of crew activity required to operate the airplane, and reflect the latest knowledge and experience available.
- Supplementary Procedures chapter covers those procedures accomplished as required rather than routinely on each flight.
- Performance Dispatch (PD) chapter contains performance information necessary for self dispatch.
- Performance Inflight (PI) chapter contains information necessary for inflight use.

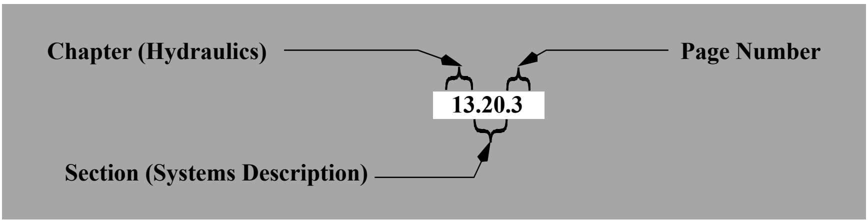
Volume 2 – Chapters 1 through 15 contain general airplane and systems information. These chapters are generally subdivided into sections covering controls and indicators and systems descriptions.

Quick Reference Handbook (QRH) – The QRH covers normal checklists, non–normal checklists, operational information, performance information necessary for inflight use (PI) on an expedited basis, and maneuvers.

Page Numbering

The FCOM uses a decimal page numbering system. The page number is divided into three fields; chapter, section, and page. An example of a page number for the hydraulics chapter follows: chapter 13, section 20, page 3.

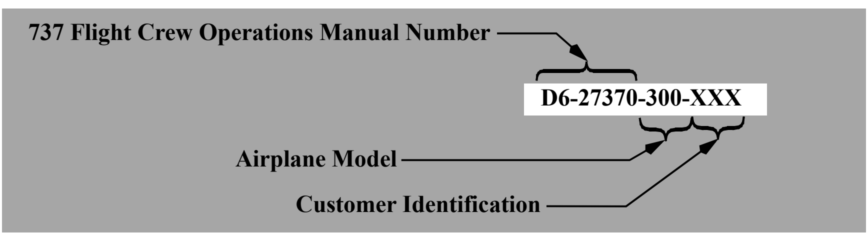
Example Page Number



Page Identification

Each page is identified by a customer document number and a page date. The customer document number is composed of the general 737 FCOM number, D6–27370–, and is followed by the customer identification. The page date is the date of publication of the manual or the most recent revision date.

Example Page Identification



Warnings, Cautions, and Notes

The following levels of written advisories are used throughout the manual.

WARNING: An operating procedure, technique, etc., that may result in personal injury or loss of life if not carefully followed.

CAUTION: An operating procedure, technique, etc., that may result in damage to equipment if not carefully followed.

Note: An operating procedure, technique, etc., considered essential to emphasize. Information contained in notes may also be safety related.

Flight Crew Operations Manual Configuration

Customer airplane configuration determines the data provided in this manual. The Boeing Company keeps a list of each airplane configuration as it is built and modified through the service bulletin process. The FCOM does not reflect customer originated modifications without special contract provisions.

Customer Configured Airplane Effectivity

Differences in airplane configuration for customer specific documents may be shown by the use of airplane effectivity throughout Volumes 1, 2 and QRH. The following rules are used to express airplane effectivity within customer documents:

- airplane effectivity can be displayed in one of four formats; by tabulation number, serial number, registry number or airplane number (customer defined). The default FCOM/QRH document effectivity display is by serial number
- airplane effectivities are listed in alpha-numeric order. A range of airplanes is defined by a dash, e.g. YZ008 - YZ014. A comma in the effectivity range indicates a break in the range, e.g. YZ008 - YZ014, YZ019, YZ021 - YZ025
- airplane effectivities apply only to the paragraph, illustration, operational note, procedural step, etc. and to subordinate items (if any) just below (except for titles) the specific effectivity range annotation;

Example (with subordinate items):

YZ008 - YZ014
Tail skid ....Check

Verify that the tail skid is not damaged.

Horizontal stabilizer and elevator ....Check

In this example, the effectivity YZ008 - YZ014 applies to the first procedural step (Tail skid.....) and further indented/subordinate step (Verify....). The effectivity does not apply to the next equivalently indented step (Horizontal stabilizer.....).

Example (without subordinate items):

YZ008 - YZ014
CABIN TEMPERATURE selector.. As needed
CABIN AIR CONDITIONING... As needed

In this example, the effectivity YZ008 - YZ014 applies to the first procedural step (CABIN TEMPERATURE selector.....) only. The effectivity does not apply to the next procedural step (CABIN AIR CONDITIONING.....).

When airplane effectivities are centered immediately below a checklist title, the entire checklist applies to the listed airplanes. In the following example, the PACK checklist is applicable to YZ008 - YZ014 only:

PACK

YZ008 - YZ014

Schematic Symbols

Symbols shown are those which may not be identified on schematic illustrations.

Preface — Abbreviations

General

The following abbreviations may be found throughout the manual. Some abbreviations may also appear in lowercase letters. Abbreviations having very limited use are explained in the chapter where they are used. The abbreviations are general in nature and may or may not apply to a customer's airplane configuration.

A	
A/P	Autopilot
A/T	Autothrottle
AC	Alternating Current
ACARS	Aircraft Communications Addressing and Reporting System
ACP	Audio Control Panel
ACQ	Acquire
ACT	Active
ADF	Automatic Direction Finder
ADIRU	Air Data Inertial Reference Unit
ADM	Air Data Module
ADS-B	Automatic Dependent Surveillance-Broadcast
AED	Automatic External Defibrillator
AFDS	Autopilot Flight Director System
AFE	Above Field Elevation
AFM	Airplane Flight Manual (FAA approved)
AGL	Above Ground Level
AI	Anti-Ice
AIL	Aileron
ALT	Altitude
ALTN	Alternate
AM	Amplitude Modulation
ANP	Actual Navigation Performance
ANT	Antenna
AOA	Angle of Attack
AOR	Area of Responsibility
APP	Approach
APU	Auxiliary Power Unit
ARINC	Aeronautical Radio, Incorporated
ARPT	Airport
ARTE	Above Runway Threshold Elevation
ATA	Actual Time of Arrival
ATC	Air Traffic Control
ATT	Attitude
AUTO	Automatic
AUX	Auxiliary
AVAIL	Available
B	

B/C or BCRS	Back Course
BARO	Barometric
BAT/BATT	Battery
BRT	Bright
BTL DISCH	Bottle Discharge (fire extinguishers)
BTP	Bromotriflurpropene (fire extinguishers)
C	
C	Captain Celsius Center
CANC/ RCL	Cancel/Recall
CB	Circuit Breaker
CDFA	Continuous Descent Final Approach
CDU	Control Display Unit
CG	Center of Gravity
CHKL	Checklist
CLB	Climb
COMM	Communication
CON	Continuous
CONFIG	Configuration
CRZ	Cruise
CTL	Control
D	
DA	Decision Altitude
DDA	Derived Decision Altitude
DC	Direct Current
DDG	Dispatch Deviations Guide
DEP ARR	Departure Arrival
DES	Descent
DEU	Display Electronics Unit
DISC	Disconnect
DME	Distance Measuring Equipment
DSPL	Display
E	
E/D	End of Descent
E/E	Electrical and Electronic
EASA	European Aviation Safety Agency
EBAW	Enhanced Bank Angle Warning
ECS	Environmental Control System
EEC	Electronic Engine Control
EFIS	Electronic Flight Instrument System
EGPWS	Enhanced Ground Proximity Warning System
EGT	Exhaust Gas Temperature
ELEC	Electrical
ELEV	Elevator
ENG	Engine
EOSID	Engine Out Standard Instrument Departure
EXEC	Execute
EXT	Extend

F	
F	Fahrenheit
F/D or FLT DIR	Flight Director
F/O	First Officer
FA	Flight Attendant
FAF	Final Approach Fix
FAP	Final Approach Point
FAS	Final Approach Segment
FCC	Flight Control Computer
FCTL	Flight Control
FCTM	Flight Crew Training Manual
FFM	Force Fight Monitor
FL	Flight Level
FMA	Flight Mode Annunciation
FMC	Flight Management Computer
FMS	Flight Management System
FPA	Flight Path Angle
FPV	Flight Path Vector
FSEU	Flap Slat Electronic Unit
G	
G/P	Glide Path
G/S	Glide Slope
GA	Go-Around
GBAS	Ground-Based Augmentation System
GEN	Generator
GLS	GBAS Landing System

GP	Glide Path
GPS	Global Positioning System
GPWS	Ground Proximity Warning System
H	
HDG	Heading
HDG REF	Heading Reference
HDG SEL	Heading Select
HPA	Hectopascals
HUD	Head-Up Display
HYD	Hydraulic
I	
IAN	Integrated Approach Navigation
IAP	Instrument Approach Procedure
IAS	Indicated Airspeed
IAW	In Accordance With
IDENT	Identification
ILS	Instrument Landing System
IMMR	Integrated Multi-Mode Receiver
IN	Inches
INBD	Inboard
IND LTS	Indicator Lights
INOP	Inoperative
INTC CRS	Intercept Course
ISFD	Integrated Standby Flight Display
ISLN	Isolation
K	

K	Knots
KGS	Kilograms
L	
L	Left
LAT	Latitude
LBS	Pounds
LDA	Localizer-type Directional Aid
LDG ALT	Landing Altitude
LE	Leading Edge
LIM	Limit
LNAV	Lateral Navigation
LOM	Locator Outer Marker
LONG	Longitude
LVL CHG	Level Change
M	
MAG	Magnetic
MAN	Manual
MCP	Mode Control Panel
MDA	Minimum Descent Altitude
MEL	Minimum Equipment List
MFD	Multifunction Display
MIN	Minimum
MKR	Marker
MMO	Maximum Mach Operating Speed
MOD	Modify
MTRS	Meters
MVA	Minimum Vectoring Altitude
MX	Maintenance
N	
N1	Low Pressure Rotor Speed
N2	High Pressure Rotor Speed
NAV RAD	Navigation Radio
ND	Navigation Display
NDB	Non-Directional Beacon
NGS	Nitrogen Generation System
NM	Nautical Miles
NORM	Normal
NPS	Navigation Performance Scales
O	
OHU	Overhead Unit
OPT	Onboard Performance Tool
OVHD	Overhead
OVRD	Override
P	
PASS	Passenger
PCU	Power Control Unit
PERF INIT	Performance Initialization
PF	Pilot Flying
PFC	Primary Flight Computers
PIC	Pilot In Command
PM	Pilot Monitoring
PNL	Panel
POS	Position

POS INIT	Position Initialization
PRI	Primary
PRW	Perspective Runway
PTU	Power Transfer Unit
PWS	Predictive Windshear System
R	
R	Right
RA	Radio Altitude Resolution Advisory
RAAS	Runway Awareness and Advisory System
RECIRC	Recirculation
REF	Reference
RET	Retract
RF	Refill
RH	Right Hand
RNP	Required Navigation Performance
RVSM	Reduced Vertical Separation Minimum
S	
S/C	Step Climb
SEL	Select
SMYD	Stall Management Yaw Damper
SPD	Speed
SPLR	Spoiler
STA	Station
STAB	Stabilizer
STAT	Status
STD	Standard

STS	Speed Trim System
T	
T/D	Top of Descent
T or TK or TRK	Track
T or TRU	True
TA	Traffic Advisory
TAI	Thermal Anti-Ice
TAT	Total Air Temperature
TCAS	Traffic Alert and Collision Avoidance System
TDZE	Touch Down Zone Elevation
TE	Trailing Edge
TFC	Traffic
THR HLD	Throttle Hold
TO	Takeoff
TO/GA	Takeoff/Go–Around
U	
UPR DSPL	Upper Display
UTC	Universal Time Coordinated
V	
V/S	Vertical Speed
V1	Takeoff Decision Speed
V2	Takeoff Safety Speed
VA	Design Maneuvering Speed
VHF	Very High Frequency

VMO	Maximum Operating Speed
VNAV	Vertical Navigation
VOR	VHF Omnidirectional Range
VR	Rotation Speed
VREF	Reference Speed
VSD	Vertical Situation Display
VTK	Vertical Track
W	
WPT	Waypoint
WXR	Weather Radar
X	
XTK	Cross Track

Preface — Chapter 0
Revision Record — Section 4

Revision Transmittal Letter

To: All holders of The Boeing Company 737 Flight Crew Operations Manual (FCOM), Boeing Document Number D6-27370-TBC.

Subject: Flight Crew Operations Manual Revision.

This revision reflects the most current information available to The Boeing Company 60 days before the subject revision date. The following revision highlights explain changes in this revision. General information below explains the use of revision bars to identify new or revised information.

Revision Record

No.	Revision Date	Date Filed	No.	Revision Date	Date Filed
38	March 31, 2016		39	September 15, 2016	
40	March 16, 2017		41	September 14, 2017	
42	March 15, 2018		43	September 20, 2018	
44	March 21, 2019		45	September 19, 2019	
46	March 19, 2020		47	September 17, 2020	
48	March 18, 2021		49	September 2, 2021	
50	March 3, 2022		51	September 30, 2022	
52	March 31, 2023		53	September 30, 2023	
54	March 30, 2024				

General

The Boeing Company issues FCOM revisions to provide new or revised procedures and information. Formal revisions also incorporate appropriate information from previously issued FCOM bulletins.

The revision date is the approximate date the manual is approved for printing. The revision is mailed a few weeks after this date. This manual is effective upon receipt and supersedes any manual (with the same document number) with a previous revision number.

Formal revisions include a Transmittal Letter, a new Revision Record, Revision Highlights, and a current List of Effective Pages. Use the information on the new Revision Record and List of Effective Pages to verify the FCOM content.

Pages containing revised technical material have revision bars associated with the changed text or illustration. Editorial revisions (for example, spelling corrections) may have revision bars with no associated highlight.

The Revision Record should be completed by the person incorporating the revision into the manual.

Filing Instructions

Consult the List of Effective Pages (0.5). Pages identified with an asterisk (*) are either replacement pages or new (original) issue pages. Remove corresponding old pages and replace or add new pages. Remove pages that are marked DELETED; there are no replacement pages for deleted pages.

Be careful when inserting changes not to throw away pages from the manual that are not replaced. Using the List of Effective Pages (0.5) can help determine the correct content of the manual.

Revision Highlights

This section (0.4) replaces the existing section 0.4 in your manual.

Throughout the manual, airplane effectivity may be updated to reflect coverage as listed on the Preface - Model Identification page, or to show service bulletin airplane effectivity. Highlights are not supplied.

This manual is published from a database; the text and illustrations are marked with configuration information. Occasionally, because the editors rearrange the database markers, or mark items with configuration information due to the addition of new database content, some customers may receive revision bars on content that appears to be unchanged. Pages may also be republished without revision bars due to slight changes in the flow of the document.

Performance Data:

The Table of Contents designator for the Alternate Deceleration Rate option selection has been updated from AB4 to ALT-AB to more correctly align with the option description and the associated performance data changes. This change will cause the publishing system to identify each performance package affected as new even when the section existed previously. Revision information for other changes will still be included.

Chapter 0 - Preface

Section 1 - Model Identification

General

0.1.1 - Revised to add/change an airplane entry.

Section 6 - Bulletin Record

General

0.6.3 - Revised to reflect current bulletin status.

0.6.7 - Revised to reflect current bulletin status.

0.6.8 - Revised to reflect current bulletin status.

Section 45 - Bulletins

File Highlight

B.45.1 - Bulletin revised to add LGTS (Thessaloniki) Runway 10, Approach, to the airport/runway combinations susceptible to false PWS alerts listing.

Section 123 - Bulletins

File Highlight

B.123.1 - Bulletin revised to update the Background Information, Operating Instructions, and Administrative Information sections.

Chapter L - Limitations

Section 10 - Limitations and Operational Information

Autopilot/Flight Director System

L.10.7 - Added crosswind limit of 25 knots for CAT IIIb operations.

L.10.8 - Added single engine flap restriction for CATIIIb operations.

Chapter NP - Normal Procedures

Section 21 - Amplified Procedures

Preliminary Preflight Procedure – Captain or First Officer

NP.21.4 - Added note about activation of the PASSENGER OXYGEN switch causing activation of the audible horn and DON OXYGEN sign in the supernumerary cabin.

Preflight Procedure – First Officer

NP.21.16 - Added instruction "Supernumerary sign - AUTO or ON" for BCF, Special Freighter aircraft.

NP.21.22 - Added step for the 737-800BCF to open the flight deck door to allow check of the Main Deck Alerting System.

Before Takeoff Procedure

NP.21.36 - Added step to notify supernumeraries to prepare for takeoff.

Landing Procedure - ILS or GLS

NP.21.64 - Added step to notify supernumeraries to prepare for landing.

Landing Procedure - Instrument Approach using VNAV

NP.21.71 - Added step to notify supernumeraries to prepare for landing.

Chapter SP - Supplementary Procedures

Section 1 - Airplane General, Emer. Equip., Doors, Windows

Main Deck Cargo Door Operation

SP.1.7 - Added Main Deck Cargo Door Operation SP for the 737-800BCF.

Section 2 - Air Systems

Unpressurized Takeoff and Landing

SP.2.7 - Added step to avoid high rates of descent for supernumerary comfort.

Section 5 - Communications

Cockpit Voice Recorder Test

SP.5.2 - Added section "Cockpit Voice Recorder Test" for aircraft with the Allied Signal control panel 980-6616-001.

Section 12 - Fuel

Ground Transfer of Fuel

SP.12.3 - Added caution statement for ground transfer of fuel with supernumeraries onboard.

Section 16 - Adverse Weather

Turbulence

SP.16.26 - Added information for freighters about notifying supernumeraries prior to entering areas of reported turbulence.

SP.16.27 - Deleted Structural Considerations section from the Severe Turbulence procedure.

SP.16.27 - Deleted Climb, Cruise and Descent Considerations section from the Severe Turbulence procedure.

SP.16.27 - Deleted Manual Flight in Severe Turbulence section from the Severe Turbulence procedure.

VREF

PI.20.6 - Updated header to show VREF reference altitude.

Flight With Unreliable Airspeed / Turbulent Air Penetration

PI.20.82 - Added Flaps 1 and Flaps 5 Unreliable Airspeed Go-Around tables for additional go-around flaps options.

PI.20.82 - Added Flaps 1 and Flaps 5 Unreliable Airspeed Go-Around tables for additional go-around flaps options.

PI.20.83 - Updated Go-Around F15 table for airport altitude 14000 ft for cross model consistency.

Section 22 - Advisory Information

Non-Normal Configuration Landing Distance

PI.22.4 - Updated LOSS OF SYSTEM A AND SYSTEM B, MANUAL REVERSION, and LOSS OF SYSTEM B non-normal landing configurations to use constant braking coefficients of friction and to be consistent with current standard Boeing calculation methods. Updated All Flaps Up Landing and Trailing Edge Flaps Up Landing non-normal landing configurations to use Flaps Up reverse thrust effectiveness factor for all runway conditions. Due to publishing system limitations, the revision bar was applied to all the non-normal landing tables. Other non-normal landing tables not mentioned in this highlight had no data change.

Section 26 - Text

General

PI.26.6 - Added clarification on VREF in Flight with Unreliable Airspeed Final Approach table.

Performance Package 30
737-700W CFM56-7B26 KG JAA CATF/M

Section 30 - General

VREF

PI.30.7 - Updated header to show VREF reference altitude.

Flight With Unreliable Airspeed/Turbulent Air Penetration

PI.30.83 - Added Flaps 1 and Flaps 5 Unreliable Airspeed Go-Around tables for additional go-around flaps options.

PI.30.83 - Added Flaps 1 and Flaps 5 Unreliable Airspeed Go-Around tables for additional go-around flaps options.

PI.30.84 - Updated Go-Around F15 table for airport altitude 14000 ft for cross model consistency.

Section 32 - Advisory Information

Non-Normal Configuration Landing Distance

PI.32.3 - Updated LOSS OF SYSTEM A AND SYSTEM B, MANUAL REVERSION, and LOSS OF SYSTEM B non-normal landing configurations to use constant braking coefficients of friction and to be consistent with current standard Boeing calculation methods. Updated All Flaps Up Landing and Trailing Edge Flaps Up Landing non-normal landing configurations to use Flaps Up reverse thrust effectiveness factor for all runway conditions. Due to publishing system limitations, the revision bar was applied to all the non-normal landing tables. Other non-normal landing tables not mentioned in this highlight had no data change.

Section 37 - Text

General

PI.37.6 - Added clarification on VREF in Flight with Unreliable Airspeed Final Approach table.

Performance Package 50
737-800W CFM56-7B26 C M KG FAA CATC/N

Section 50 - Pkg Model Identification

737-800W CFM56-7B26 C M KG FAA CATC/N was added as Section 50.

Section 50 - General

737-800W CFM56-7B26 C M KG FAA CATC/N was added as Section 50.

Section 51 - All Engine

Added section "51".

Section 52 - Advisory Information

Added section "52".

Section 53 - Engine Inoperative

Added section "53".

Section 54 - Alternate Mode EEC

Added section "54".

Section 55 - Gear Down

Added section "55".

Section 56 - Gear Down, Engine Inop

Added section "56".

Section 57 - Text

Added section "57".

Performance Package 60
737-900 CFM56-7B26 C FT LB FAA CATG/O

Section 60 - Pkg Model Identification

737-900 CFM56-7B26 C FT LB FAA CATG/O moved from Section 50 to 60.

Section 60 - General

737-900 CFM56-7B26 C FT LB FAA CATG/O moved from Section 50 to 60.

VREF

PI.60.4 - Updated header to show VREF reference altitude.

Flight With Unreliable Airspeed/ Turbulent Air Penetration

PI.60.49 - Updated weight array.

PI.60.67 - Updated weight array.

PI.60.76 - Added Flaps 1 and Flaps 5 Unreliable Airspeed Go Around tables for additional go-around flaps options.

PI.60.76 - Added Flaps 1 and Flaps 5 Unreliable Airspeed Go Around tables for additional go-around flaps options.

PI.60.77 - Updated Go-Around F15 table for airport altitude 14000 ft for cross model consistency and updated weight array.

Section 61 - All Engine

Section "51" moved to "61".

Section 62 - Advisory Information

Section "52" moved to "62".

Section 63 - Engine Inoperative

Section "53" moved to "63".

Section 64 - Alternate Mode EEC

Section "54" moved to "64".

Section 65 - Gear Down

Section "55" moved to "65".

Section 66 - Gear Down, Engine Inop

Section "56" moved to "66".

Section 67 - Text

Section "57" moved to "67".

General

PI.67.6 - Added clarification on VREF in Flight with Unreliable Airspeed Final Approach table.

Performance Package 70
737-900ERW CFM56-7B26 C KG M FAA CATH/P

Section 70 - Pkg Model Identification

737-900ERW CFM56-7B26 C KG M FAA CATH/P moved from Section 60 to 70.

Section 70 - General

737-900ERW CFM56-7B26 C KG M FAA CATH/P moved from Section 60 to 70.

Section 71 - All Engine

Section "61" moved to "71".

Section 72 - Advisory Information

Section "62" moved to "72".

Section 73 - Engine Inoperative

Section "63" moved to "73".

Section 74 - Alternate Mode EEC

Section "64" moved to "74".

Section 75 - Gear Down

Section "65" moved to "75".

Section 76 - Gear Down, Engine Inop

Section "66" moved to "76".

Section 77 - Text

Section "67" moved to "77".

Performance Package 80
737-900ERW CFM56-7B27 C FT LB FAA CATH/P

Section 80 - Pkg Model Identification

737-900ERW CFM56-7B27 C FT LB FAA CATH/P moved from Section 70 to 80.

Section 80 - General

737-900ERW CFM56-7B27 C FT LB FAA CATH/P moved from Section 70 to 80.

VREF

PI.80.4 - Updated header to show VREF reference altitude.

Flight With Unreliable Airspeed/ Turbulent Air Penetration

PI.80.73 - Added Flaps 1 and Flaps 5 Unreliable Airspeed Go-Around tables for additional go-around flaps options.

PI.80.73 - Added Flaps 1 and Flaps 5 Unreliable Airspeed Go-Around tables for additional go-around flaps options.

PI.80.74 - Updated Go-Around F15 table for airport altitude 14000 ft for cross model consistency.

Section 81 - All Engine

Section "71" moved to "81".

Section 82 - Advisory Information

Section "72" moved to "82".

Non-Normal Configuration Landing Distance

PI.82.4 - Updated LOSS OF SYSTEM A and LOSS OF SYSTEM B non-normal landing configurations to use appropriate reverser deployment times to achieve cross-model consistency. Due to publishing system limitations, the revision bar was applied to all the non-normal landing tables. Other non-normal landing tables not mentioned in this highlight had no data change.

Section 83 - Engine Inoperative

Section "73" moved to "83".

Section 84 - Alternate Mode EEC

Section "74" moved to "84".

Section 85 - Gear Down

Section "75" moved to "85".

Section 86 - Gear Down, Engine Inop

Section "76" moved to "86".

Section 87 - Text

Section "77" moved to "87".

General

PI.87.6 - Added clarification on VREF in Flight with Unreliable Airspeed Final Approach table.

Chapter 1 - Airplane General, Emergency Equipment, Doors, Windows

Section 10 - Dimensions

Principal Dimensions

1.10.1 - Updated wing to wing and horizontal stabilizer meters dimensions to match the AMM.

1.10.2 - Updated wing to wing and horizontal stabilizer meters dimensions to match the AMM.

1.10.3 - Changed horizontal stabilizer meters dimension to match the AMM.

1.10.4 - Added the principal dimensions of the 737-800BCF equipped with winglets.

Turning Radius

1.10.10 - Added a graphic which shows the turning radius of the 737-800 with winglets.

Section 20 - Instrument Panels

Attendant Control Panel

1.20.21 - Added a graphic which depicts the Forward Attendant Control Panel installed on airplanes with the Sky Interior.

1.20.21 - Deleted a graphic which depicts the Aft Attendant Control Panel installed on airplanes with the Sky Interior.

Supernumerary Cabin Handset

1.20.22 - Added title.

Section 30 - Controls and Indicators

Emergency Lighting and Passenger Signs

1.30.10 - Added a graphic depicting the Emergency Lighting and Passenger Sign switches.

1.30.11 - Added text which describes the No Smoking Switch.

Doors

1.30.21 - Added a graphic depicting the Exterior Door Annunciator Lights.

1.30.22 - Added paragraph describing the exterior door annunciations.

1.30.24 - Added BCF Entry/Galley Service Doors section.

1.30.25 - Added Boeing standard Converted Freighter Main Deck Cargo Door Section by configuration.

1.30.29 - Added Cargo Configuration section.

Oxygen

1.30.36 - Added graphic depicting the Observer's Eros Oronasal Oxygen Mask and Regulator.

Water System Controls

1.30.41 - Added text and graphics depicting the Water System Controls.

Section 40 - Systems Description

Lighting Systems

1.40.6 - Added content describing the Supernumerary Cabin Signs.

1.40.16 - Changed Maximum Duration hours to match the AMM.

1.40.17 - Changed Maximum Duration hours to match the AMM.

1.40.18 - Changed Maximum Duration hours to match the AMM.

Oxygen Systems

1.40.24 - Added paragraph describing the oxygen system.

1.40.27 - Added a graphic depicting the Oxygen System Schematic for BCF and Freighters.

1.40.28 - Added text which describes the flight crew oxygen system.

1.40.28 - Added text which describes the donning instruction for the flight crew oxygen masks.

1.40.36 - Added portable oxygen system section.

Fire Extinguishers

1.40.37 - Added paragraph describing the fire extinguisher.

Added Emergency Equipment Locations section.

Doors and Windows

1.40.49 - Added paragraph describing doors and windows.

1.40.49 - Changed the caution when operating entry and service doors in windy conditions.

1.40.53 - Added section describing the main deck cargo door.

Emergency Escape

1.40.59 - Added text which describes emergency evacuation for STC aircraft.

1.40.62 - Added Emergency Evacuation Routes graphic for BCF aircraft.

1.40.67 - Added a graphic depicting that no overwing escape straps are installed.

Galleys

1.40.82 - Added paragraph describing the galley.

Water System

1.40.84 - Added water system graphic.

1.40.84 - Added text which describes the heater in the potable water system.

Chapter 2 - Air Systems

Section 10 - Controls and Indicators

Bleed Air Controls and Indicators

2.10.3 - Added bleed air control and indicators graphic for airplanes with INOP Placards on Recirculation Fans.

Air Conditioning Controls and Indicators

2.10.10 - Added illustration for airplanes with INOP Placards on Recirculation Fans.

2.10.11 - Added description of Temperature Selector for 737-800BCF aircraft.

2.10.12 - Added description of AIR Temperature (TEMP) Source Selector for 737-800 Freighter aircraft.

2.10.13 - Added Recirculation Fan Switches description with note regarding removal of recirculation fans on the 737-800BCF Freighter aircraft.

Section 20 - Bleed Air System Description

Engine Bleed System Supply

2.20.6 - Added bleed air system schematic with INOP placards on recirculation fans.

Section 30 - Air Conditioning System Description

Air Conditioning Distribution

2.30.5 - Changed "bay" to "compartment".

2.30.5 - Changed "bay" to "compartment".

2.30.5 - Changed "bay" to "compartment".

2.30.6 - Changed "bay" to "compartment".

2.30.6 - Changed "bay" to "compartment".

2.30.6 - Revised wording of the EQUIPMENT COOLING OFF light to uppercase for consistency.

2.30.6 - Revised paragraph to clarify the circulation of air into the forward cargo compartment.

Section 31 - Air Conditioning System Description

Introduction

2.31.1 - Added Introduction paragraph describing Air Systems for cargo conversion aircraft.

Zone Temperature Control

2.31.5 - Added description for temperature selectors.

2.31.5 - Added description for electronic temperature controllers.

2.31.6 - Added description of failure of cabin temperature control for supernumerary cabin.

2.31.6 - Added description of unbalanced Pack temperature control mode.

Air Conditioning Distribution

2.31.7 - Added information to reflect fleet configuration.

2.31.8 - Added description of 737-800BCF Cargo Compartment.

2.31.8 - Added description of Mix Manifold Exhaust Shutoff Valve.

2.31.8 - Changed "forward cargo bay" to "forward cargo compartment". Added statement: "(Additional information about the forward cargo compartment air circulation can be found in the Forward Cargo Compartment section of this chapter)."

2.31.8 - Added information about recirculation fans in the 737-800BCF.

2.31.9 - Changed "bay" to "compartment".

2.31.9 - Changed "bay" to "compartment".

2.31.9 - Changed "bay" to "compartment".

2.31.9 - Revised wording of the EQUIPMENT COOLING OFF light to uppercase for consistency.

2.31.9 - Added paragraph describing Forward Cargo Compartment Smoke Penetration Prevention for 737-800BCF aircraft.

2.31.9 - Revised paragraph to include use of recirculation fans to provide air from the passenger cabin and E/E Cooling system to the Forward Cargo Compartment.

2.31.11 - Added graphic with new Bleed Air symbol pattern for 737-800BCF.

Section 40 - Pressurization System Description

Pressurization Outflow

2.40.4 - Added description of air circulation in 737-800BCF cargo areas.

2.40.4 - Changed "bay" to "compartment".

2.40.4 - Added information about opening of Overboard Exhaust Valve.

Auto Mode Operation

2.40.6 - Added description of initial cabin pressurization for BCF.

Chapter 3 - Anti-Ice, Rain

Section 10 - Controls and Indicators

Probe Heat Panel

3.10.4 - Added graphic for airplanes with AUTO-ON Probe Heat switches and no TAT test switch.

Section 20 - System Description

Flight Deck Window Heat

3.20.2 - Added paragraph describing window heat for windows 1 and 2 for aircraft without window 3 heat.

3.20.3 - Added paragraph describing window heat for windows 1 and 2 for aircraft without window 3 heat.

3.20.3 - Added paragraph describing window heat operation for windows 1 and 2 for aircraft without window 3 heat.

3.20.3 - Added paragraph describing window heat operation for windows 1 and 2 for aircraft without window 3 heat.

3.20.6 - Added graphic for airplanes with green ON light, no window 3 heat, windows 4 and 5 not installed, and four temperature controllers.

Chapter 4 - Automatic Flight

Section 10 - Controls and Indicators

Flight Mode Annunciations (FMAs)

4.10.26 - Revised the formatting of Callout for CWS Roll Engaged. No content change.

4.10.27 - Revised the formatting of Callout for CWS Pitch Engaged. No content change.

4.10.28 - Revised the formatting of Callout for CWS Pitch Engaged. No content change.

4.10.28 - Revised the formatting of Callout for CWS Roll Engaged. No content change.

Chapter 5 - Communications

Section 10 - Controls and Indicators

Interphone and Passenger Address Controls

5.10.12 - Added description of service phone capabilities for 737-800BCF aircraft.

5.10.13 - Added description of service interphone headset jack capabilities for 737-800BCF aircraft.

Cockpit Voice Recorder

5.10.14 - Added Allied Signal cockpit voice recorder P/N 980-6116-001 with Headphone jack.

5.10.14 - Added Erase Switch Callout for aircraft cockpit voice recorder.

5.10.14 - Added Callout for cockpit voice recorder TEST Switch operation.

5.10.15 - Added Callout describing cockpit voice recorder HEADPHONE Jack use.

5.10.15 - Added Callout describing cockpit voice recorder STATUS Light operation.

Call System

5.10.16 - Added description of Attendant CALL Light for 737-800BCF aircraft.

5.10.16 - Added description of Flight Deck Call Light for 737-800BCF aircraft.

5.10.17 - Added description of pink call light for 737-800BCF aircraft.

5.10.17 - Added description of blue call light for 737-800BCF aircraft.

5.10.18 - Added description of Attendant Call Switch two-tone chime for 737-800BCF aircraft.

Section 20 - System Description

Degraded Audio System Operation

5.20.3 - Deleted paragraph "Audio warnings for altitude alert, GPWS, and windshear are not heard....in the degraded mode".

5.20.3 - Added paragraph "Audio warnings for altitude alert, GPWS, and windshear are heard....in the degraded mode".

Service Interphone System

5.20.4 - Added Service Interphone description for 737-800BCF.

Call System

5.20.5 - Added description of Call System for 737-800BCF.

5.20.6 - Added description of Call System for 737-800BCF.

5.20.6 - Added table for 737-800BCF aircraft.

Chapter 6 - Electrical

Section 10 - Controls and Indicators

AC and DC Metering Panel

6.10.5 - Added dual battery ac and dc metering panel graphic for BCF aircrafts.

6.10.7 - Added IFE/PASS SEAT switch description for BCF aircrafts.

Chapter 7 - Engines, APU

Section 10 - Side by Side – Displays

Primary and Secondary Engine Indications

7.10.7 - Deleted 5 minutes color limitation on EGT indications

Section 11 - Over/Under – Displays

Primary Engine Indications

7.11.1 - Added engine display in kilograms with full time fuel flow displayed.

Compact Engine Displays

7.11.16 - Added compact engine display configuration in kilograms with cross-bleed display.

Chapter 8 - Fire Protection

Section 10 - Controls and Indicators

Lavatory Fire

8.10.9 - Added JAMCO lavatory smoke detector per fleet effectivity.

Section 20 - System Description

Lavatory Fire Protection and Smoke Detection

8.20.8 - Added "FWD/AFT" for system clarification. No technical changes.

8.20.8 - Added information about Lavatory Smoke Detection ALARM MODE reset.

Chapter 9 - Flight Controls

Section 10 - Controls and Indicators

Leading Edge Devices

9.10.14 - Revised the callout for the Leading Edge Devices TRANSIT Lights from "devices" to "flaps and slats".

9.10.14 - Revised the callout for the Leading Edge Devices Extended (EXT) Lights from "slat" to "flaps and slats".

9.10.14 - Revised the callout for the Leading Edge Devices Full Extended (FULL EXT) Lights from "devices" to "slats".

Section 20 - System Description

Yaw Control

9.20.13 - Revised system description for Yaw Damper section to remove the yaw damper indicator for aircraft without the option of position indicator.

Flaps and Slats

9.20.20 - Added content to clarify Flap Load Relief system.

9.20.24 - Added notation to clarify Flight Deck Effects resultant from asymmetry and skew of the LE devices or TE flaps.

9.20.24 - Added notation to clarify Flight Deck Effects resultant from asymmetry and skew of the LE devices or TE flaps.

9.20.24 - Revised the description for the Leading Edge Devices TRANSIT from "devices" to "flaps and slats".

9.20.24 - Revised the description for the Leading Edge Devices EXT from "slats and flaps" to "flaps and slats" for standardization.

9.20.25 - Added notation to clarify Flight Deck Effects resultant from uncommanded motion of the LE devices or TE flaps.

9.20.25 - Added notation to clarify Flight Deck Effects resultant from uncommanded motion of the LE devices or TE flaps.

Chapter 10 - Flight Instruments, Displays

Section 11 - PFD/ND – Displays

PFD – Attitude Indications

10.11.22 - Added illustration for aircraft equipped with integrated cue command bar and rising runway.

10.11.28 - Updated the Radio Altitude Call Out #1 to better describe the Display Box highlight when descending through 2500 feet AGL.

10.11.28 - Updated the Radio Altitude Call Out #1 to better describe the Display Box highlight when descending through 2500 feet AGL.

PFD – Altitude Indications

10.11.33 - Updated the Metric Digital Readout to include the cyan metric symbol-M.

10.11.34 - Added illustration for aircraft without QFE Altimeter option.

PFD – Vertical Speed Indications

10.11.40 - Added illustration for VSI without TCAS advisory.

PFD Failure Flags

10.11.43 - Added illustration of PFD failure flags when RA is below ADI.

PFD Annunciations and Alerts

10.11.51 - Updated the Metric Digital Readout to include the cyan metric symbol-M.

Navigation Displays – Failure Indications and Flags

10.11.79 - Added illustration of failure flags for track up display, dual ADF receiver and no IAN.

Section 31 - PFD/ND – Primary Flight Display

Attitude

10.31.2 - Added sentence describing the pitch limit indication for flaps not up.

Traffic Alert and Collision Avoidance (TCAS) Indications

10.31.6 - Added sentence where TCAS advisories are in the attitude indication area only.

Section 41 - PFD/ND – Navigation Displays

ND Symbology

10.41.6 - Added symbology for system source annunciation for aircraft without GLS.

Chapter 11 - Flight Management, Navigation

Section 10 - Controls and Indicators

Flight Management System

11.10.2 - Added LCD MCDU.

11.10.5 - Added LCD MCDU.

11.10.5 - Added MCDU.

Inertial System

11.10.22 - Added ADIRS 69-73713-20 with GLS INOP and ILS INOP stickers.

Section 20 - Navigation Systems Description

Radio Navigation Systems

11.20.9 - Added description without GLS option.

Section 40 - FMC Preflight

Preflight Pages

11.40.50 - Added non-aspirated TAT probe without thrust bump.

Section 42 - FMC Cruise

Navigation Data

11.42.63 - Added dual FMC with GPS and no GLS.

11.42.63 - Added standard configuration without GLS.

Section 43 - FMC Descent and Approach

Approach

11.43.33 - Added approach information without GLS.

Chapter 12 - Fuel

Section 10 - Controls and Indicators

Fueling / Defueling / Measurement

12.10.11 - Added fueling panel in kilograms without preselect.

Section 20 - System Description

Fuel Quantity Indication

12.20.3 - Revised Fuel Quantity Indication description to be consistent across 737 airplane models.

12.20.3 - Added the description for the Total Fuel Quantity displayed on the Upper Display Unit for Fuel Quantity Indication system.

Chapter 13 - Hydraulics

Section 20 - System Description

Introduction

13.20.1 - Added main deck cargo door to the list in Hydraulics system.

13.20.3 - Added hydraulic schematic with main deck cargo door.

A and B Hydraulic Systems

13.20.3 - Modified "landing gear transfer unit" to "landing gear transfer valve" to match AMM.

13.20.5 - Modified Title from "LANDING GEAR TRANSFER UNIT" to “LANDING GEAR TRANSFER VALVE" to match AMM.

13.20.5 - Modified paragraph content from "LANDING GEAR TRANSFER UNIT" to “LANDING GEAR TRANSFER VALVE" to match AMM.

Chapter 14 - Landing Gear

Section 20 - System Description

Landing Gear Operation

14.20.2 - Modified Title from "LANDING GEAR TRANSFER UNIT" to “LANDING GEAR TRANSFER VALVE" to match AMM.

14.20.2 - Modified paragraph content from "LANDING GEAR TRANSFER UNIT" to “LANDING GEAR TRANSFER VALVE" to match AMM.

Nose Wheel Steering

14.20.3 - Modified paragraph content from "LANDING GEAR TRANSFER UNIT" to “LANDING GEAR TRANSFER VALVE" to match AMM.

Air/Ground System

14.20.7 - Added third extinguishing bottle for Cargo Fire Protection.

14.20.8 - Modified table content from "LANDING GEAR TRANSFER UNIT" to “LANDING GEAR TRANSFER VALVE" to match AMM.

Chapter 15 - Warning Systems

Section 10 - Controls and Indicators

Proximity Switch Electronic Unit Light

15.10.2 - Revised to add reference to MAIN CARGO door annunciator.

Ground Proximity Warning System (GPWS)

15.10.10 - Added GPWS inhibit switch graphic to accommodate airplanes with flap, gear, and terrain inhibit switches.

Section 20 - System Description

Introduction

15.20.1 - Modified paragraph to remove "flight attendant" as this does not apply to 737-800 BCF aircraft.

Master Caution Lights

15.20.5 - Added ice detector light.

15.20.5 - Added SPSEU light to annunciation list.

15.20.5 - Added lavatory smoke light.

15.20.6 - Added annunicator content.

15.20.6 - Added annunicator content.

15.20.6 - Added annunicator content.

15.20.6 - Added annunicator content.

15.20.6 - Added annunicator content.

15.20.6 - Revised to provide MID EXIT doors system annunciation.

15.20.6 - Revised to add reference to MAIN CARGO door annunciator.

15.20.6 - Added airstair light.

15.20.6 - Added high altitude landing - INOP light.

Warning Systems

15.20.8 - Added information to accommodate airplanes equipped with main deck cargo door.

15.20.11 - Deleted "FMC outputs" to match with the System Design document.

Ground Proximity Alerts

15.20.16 - Replaced "unsafe radio altitude" with "unsafe altitude" for clarity.

Tail Skid

15.20.41 - Revised Tail Skid Detail graphic to display the visible green indicator on the cartridge.

Preface — Chapter 0
Bulletin Record — Section 6

General

The Boeing Company issues Flight Crew Operations Manual Bulletins to provide important information to flight crews prior to the next formal revision of the Flight Crew Operations Manual. The transmitted information may be of interest to only specific Operators or may apply to all Operators of this model airplane. Each bulletin will vary.

Bulletins are dated and numbered sequentially for each operator. Each new bulletin is recorded in this record when received and filed as instructed. A bulletin may not apply to all airplane models. When appropriate, the next formal FCOM revision will include an updated bulletin record page to reflect current bulletin status.

Temporary information is normally incorporated into the manual at the next formal revision. When the condition remains temporary after a bulletin incorporation, the temporary paragraphs are identified by a heading referencing the originating bulletin. When the temporary condition no longer exists, the bulletin is cancelled and the original manual content is restored.

Bulletin status is defined as follows:

- In Effect (IE) – the bulletin contains pertinent information not otherwise covered in the Flight Crew Operations Manual. The bulletin remains active and should be retained in the manual
- Incorporated (INC) – the bulletin operating information has been incorporated into the Flight Crew Operations Manual. However, the bulletin remains active and should be retained in the manual
- Cancelled (CANC) – the bulletin is no longer active and should be removed from the Flight Crew Operations Manual. All bulletins previously cancelled are no longer listed in the Bulletin Record.

The person filing a new or revised bulletin should amend the Bulletin Record as instructed in the Administrative Information section of the bulletin. When a bulletin includes replacement pages for the Flight Crew Operations Manual or QRH, the included pages should be filed as instructed in the Flight Crew Operations Manual Information section of the bulletin.

Number	Subject	Date	Status
TBC-3 R1	Standby Power Test	November 8, 1999	IE
TBC-5 R1	Window Overheat	November 15, 2000	IE
TBC-6	Possible Autopilot Low Frequency Pitch Oscillation During Flap Extension While in a Turn	January 29, 1999	IE
TBC-7	Engine Overheat/Fire and APU Fire Detection	January 29, 1999	IE
TBC-8 R1	Uncommanded Engine Acceleration Due to an Engine Fuel Control Fault	December 17, 1999	IE

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-3 R1

IssueDate: November 8, 1999

Subject: Standby Power Test

Reason: To inform flight crews of an anomaly during a standby power test.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Flight test has revealed that when performing the standby power test, an anomaly in the stall management/yaw damper (-1SMYD) software may cause several faults to appear after the test is completed. These faults include:

- Captain's airspeed indicator VMO arc disappears
- SPD LIMIT flag (amber) displays on the mach airspeed indicator
- MACH TRIM light illuminates
- AUTO SLAT light illuminates
- ELEC light illuminates

These faults must be cleared by maintenance recycling the -1SMYD circuit breaker and/or clearing the fault in the Electrical Metering Panel prior to flight.

The condition will be fixed with the installation of -2SMYD or higher software. Component Service Bulletin 285A1010-27-01, released February 25, 1999, provides information on the upgrade to the -2SMYD software. Component Service Bulletin 285A1010-27-03, released February 25, 1999, provides information on the upgrade to the -4SMYD software. These Service Bulletins and this Operations Manual bulletin apply to airplanes with manufacturer's line numbers 1 through 51.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-3 R1 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 285A1010-27-01 or 285A1010-27-03. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-5 R1

IssueDate: November 15, 2000

Subject: Window Overheat

Reason: To inform flight crews of a window OVERHEAT light anomaly.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Flight tests have revealed power transfers may trigger the window OVERHEAT lights to illuminate due to a relay/bus timing incompatibility.

Vendor Service Bulletin Koito 8300-30-040 provides information on the upgrade that fixes this anomaly.

Operating Instructions

If the window OVERHEAT lights illuminate during a power transfer, the window heat switches must be momentarily cycled OFF, and then back ON to clear the problem. If the lights fail to extinguish, accomplish the Window Overheat non-normal procedure

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-5 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Vendor Service Bulletin Koito 8300-30-040. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your FCOM, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

BOEING

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-6

IssueDate: January 29, 1999

Subject: Possible Autopilot Low Frequency Pitch Oscillation During Flap Extension While in a Turn

Reason: To inform flight crews of the possibility that the autopilot may not hold altitude when extending flaps from Flaps UP to Flaps 1.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During a recent test flight on the 737-700 with the autopilot engaged in command (CMD) mode, a low frequency pitch oscillation was experienced while entering a turn with flaps UP and simultaneously selecting flaps 1. Airspeed at the time was greater than 230 knots. This oscillation occurs as a result of a combination of aircraft loading near the aft CG limit, off nominal rigging of the elevator tab shift mechanism and FCC timing of the tab shift with flap extension.

Operating Instructions

Although the probability of having all of the parameters required to trigger this anomaly is considered to be low, flight crews should be made aware of this possible condition and should monitor autopilot performance while turning and simultaneously selecting flaps from UP to 1. In some cases, disconnecting the autopilot and retrimming may be necessary. This anomaly has not been experienced at any other flap position.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-6 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737– 27–1215. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-7

IssueDate: January 29, 1999

Subject: Engine Overheat/Fire and APU Fire Detection

Reason: To inform flight crews of a potential malfunction of the engine overheat/fire and APU fire detection system.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

This bulletin was originally issued for your initial airplane deliveries and subsequently cancelled (CANC). It is being re-issued to cover follow-on deliveries.

A defect in the manufacturing process of the engine and APU fire detector loops may allow a slow leak of the internally contained helium gas. This slow leak may result in an increase in the predetermined temperature limit for a fire or overheat condition alert.

The wheel well fire detection and wing-body overheat detection systems are not affected.

Boeing issued an All-Operator telex, same subject, requesting the operators to inspect their 737-700 and series airplanes and spares inventory to identify the fire detector assemblies and fire detector elements serial numbers. Flight crews flying airplanes with suspect parts should use the operating instructions contained in this bulletin until repairs have been completed.

Operating Instructions

Engine Overheat

If an engine overheat condition occurs (ENG OVERHEAT light illuminates), it should be treated as an engine fire and the Engine Fire, Severe Damage or Separation non-normal procedure should be accomplished.

APU Operation

The APU system does not have overheat detection and the predetermined temperature limit for a APU fire may have increased. The APU should not be operated in flight unless an emergency condition requires its use. If the APU is started in flight, land at the nearest suitable field.

Note: Dispatch configurations requiring the use of the APU during flights are not authorized i.e. Dispatch with an Engine Driven Generator System inoperative.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-7 "In Effect" (IE).

This condition is temporary until the system is modified. The All-Operator telex provides instructions on how to receive replacement parts.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-8 R1

IssueDate: December 17, 1999

Subject: Uncommanded Engine Acceleration Due to an Engine Fuel Control Fault

Reason: To inform flight crews of a CFM 56-7 engine anomaly.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

There have been five (5) cases of uncommanded fuel flow accelerations on CFM56-7 engines. These are the result of an engine fuel control anomaly that can lead to excessive fuel flow, causing uncommanded thrust increase, engine RPM and/or EGT limit exceedances, or engine surge.

The first three (3) events occurred at near idle engine power during approach. For two (2) of the three (3) events, flight crew action was necessary to shut down the effected engine.

Two (2) subsequent events of uncommanded fuel flow accelerations occurred on an airplane which had EEC Software version 7BI installed. These events occurred on the ground, one while parking at the gate and one while taxiing. It should be noted this software was designed to minimize but not eliminate repeat occurrences of uncommanded fuel flow acceleration.

Alert Service Bulletin CFM56-7B S/B 73-A026, dated January 20, 1999, introduced EEC software version 7.B.J which provided a significant improvement in the Fault Accommodation Logic. There have been no additional uncommanded engine acceleration events since the release of software version 7.B.J. This Alert Service Bulletin and this Operations Manual Bulletin apply to airplanes with manufacturer's line numbers 1 through 193. Line number 194 and on received the software fix during production.

In addition, a review of the current 737 non-normal procedures has been conducted and the results include a new procedure for an engine limit, surge, stall condition. This change aligns the 737 non-normal procedure with other Boeing models' non-normal procedure.

Operating Instructions

If one or more of the following occurs, perform the Engine Limit/Surge/Stall procedure:

- engine RPM or EGT indications are abnormal, approaching or exceeding limits
- no response to thrust lever movement
- abnormal engine noises.

Note: Flight crews should remain vigilant for uncommanded engine acceleration during all phases of flight.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-8 R1 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Alert Service Bulletin CFM56-7B S/B 73-A026. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-9 R1

IssueDate: June 30, 2004

Subject: APU DC Fuel Pump Operational Anomaly

Reason: To inform flight crews of an APU DC fuel pump operational anomaly.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

The APU DC Fuel Pump is intended to provide pressurized fuel to the APU when no AC fuel pump is operating.

Flight testing has revealed that the APU DC fuel pump will not operate automatically when the APU fuel control senses a low fuel pressure condition, unless the center tank fuel pump switches are in the ON position. This condition is caused by the routing of the low fuel pressure signal through the center tank pump switches. When these switches are in the OFF position, the low pressure signal is interrupted.

Operating Instructions

With the center tank fuel pump switches in the OFF position, the APU DC fuel pump does not function as described in the Operations Manual and should be treated as inoperative.

Note: With no AC power available and the DC fuel pump inoperative, APU starts are not recommended above 25,000 feet.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-9 R1 "In Effect" (IE).

This anomaly is corrected by Boeing Service Bulletin 737-28-1152. This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in the operator’s fleet have been modified.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-11 R1

IssueDate: March 26, 1999

Subject: Collins ILS/GPS Multi-Mode Receiver (MMR) Failure

Reason: To inform flight crews of the lack of failure indications associated with certain internal Multi-Mode Receiver (MMR) failures.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Flight testing has shown that certain internal MMR failures can occur which do not display fault indications or failure flags. In this event, the associated ILS and GPS will not function. ILS frequency, localizer deviation and glideslope deviation indicators will not be displayed. Normal GPS functions and updates will not be available and the altitude range arc will move erratically if displayed.

Collins GLU-920 Service Bulletins (8 and 10 through 15) provide information on the upgrade that fixes the anomaly.

Operating Instructions

If course and glideslope deviation indicators are not displayed, consider the event as an ILS receiver failure. Dual channel approach and autoland will not be available. Consider the effect on approach minimums and select an appropriate course of action. When flight conditions permit, view FMC Position Page 2 and determine if a GPS position is missing. If so, consider the associated GPS receiver as failed.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-11 R1 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Collins GLU-920 Service Bulletins (8 and 10 through 15). If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-12 R1

IssueDate: September 6, 1999

Subject: Inadvertent RTO Autobraking During Landing

Reason: To inform flight crews of the potential risk of RTO braking during landing on 737-600/700/800 airplanes.

The purpose of this reissue is to provide Service Letter information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

A 737-800 operator has reported three incidents of inadvertent selection of RTO braking during landing roll. In each case, flight crews were attempting to disarm the autobrakes by placing the Auto Brake Select Switch to the "OFF" position. The RTO events were caused by over-rotating the switch past the "OFF" position to the "RTO" position. Boeing Flight Test and Boeing Engineering have confirmed that RTO arming and application logic in the autobrake system may allow RTO braking to engage if the switch is placed in the "RTO" position at any speed after landing autobraking has initiated.

Boeing Service Letter 737-SL-32-078 provides information concerning an autobrake software modification to re-verify the arming conditions when RTO is selected during landing roll. This modification will prevent RTO braking even if the switch is inadvertently placed in the "RTO" position during landing.

Operating Instructions

Although the autobrake system can be disarmed by placing the Auto Brake Select Switch in the "OFF" position, Boeing recommends the use of manual braking to disarm the autobrake system. Flight crews may also disarm the autobrakes by moving the SPEED BRAKE lever to the down detent if speed brakes are not further required to assist stopping.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-12 R1 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Letter 737-SL-32-078. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company **Seattle, Washington 98124-2207**	737

Number: TBC-13 R1

IssueDate: April 23, 1999

Subject: Nuisance PWS Fail Annunciation

Reason: To inform flight crews of predictive windshear system operational conditions that can cause the subject annunciation to be displayed.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Flight testing and customer reports have confirmed that a nuisance PWS FAIL annunciation will occur for approximately 30 seconds under the following conditions

- WXR has not been selected on at any time since electrical power up, and
- one or both engines are advanced for takeoff and the indicated airspeed is increasing.

This applies to the Allied Signal weather radar system with the Predictive Windshear function activated. (Allied Signal/Bendix weather radar system receiver-transmitter part number 066-50008-0405). The message will extinguish approximately 30 seconds after appearing.

Allied Signal/Bendix Service Bulletin RTA-4B-34-97 (M4508) corrects the anomaly. This service bulletin converts the weather radar RT unit part number from 066-50008-0405 to 066-50008-0406.

All airplanes prior to Line Number 347 are affected. Follow-on airplanes will have the -0406 receiver-transmitters installed prior to delivery.

Operating Instructions

To prevent the annunciation from occurring, select the weather radar system on prior to takeoff. The weather radar may then remain on or be turned off as desired for the remainder of the flight. Consider any subsequent PWS FAIL annunciation or WINDSHEAR alert as valid.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-13 R1 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Allied Signal/Bendix Service Bulletin RTA-4B-34-97 (M4508).

If you do not plan to modify all your airplanes and would like to have the contents of this operations manual bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company **Seattle, Washington 98124-2207**	737

Number: TBC-14 R1

IssueDate: June 30, 2004

Subject: AFDS Performance Degradation with Radio Altimeter Failure

Reason: To inform flight crews of potential AFDS performance degradation associated with certain Radio Altimeter failure modes.

The purpose of this reissue is to provide Service Letter information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

The LNAV function of the flight management computer (FMC) is limited to a bank angle limit of 30 degrees by the flight control computers (FCC) when the radio altitude is 400 feet or greater. Below 200 feet, LNAV is limited to 8 degrees of bank angle. Between 200 and 400 feet bank angle is limited to 15 degrees. The actual bank angle commanded by the FMC will be within these bounds.

Flight testing has confirmed that certain radio altimeter failure modes can cause degraded autopilot flight director system (AFDS) performance. These failure modes may not cause an amber RA failure flag to be displayed.

If a radio altimeter fails while transmitting a valid altitude of less than 200 feet or if the radio altimeter output never becomes valid after power up on the ground, the associated FCC, which uses that radio altimeter as its primary source of data, will use the last valid altitude received or use zero feet if no valid altitude is received after power-up. This will result in the LNAV command on that side always being limited to 8 degrees of bank angle, during either autopilot or flight director operation. Depending on the aggressiveness of the programmed turns of the active LNAV path, this failure could result in the airplane departing the LNAV path if the FMC desired commands exceed the AFDS bank limits. This failure will be indicated by the airplane symbol not following the defined (magenta) path as shown on the Navigation Display.

Operating Instructions

Boeing procedures emphasize the need for pilot monitoring of automated systems to ensure acceptable performance in flight. In this case, vigilant flight path monitoring will reveal the radio altimeter failure as a deviation from the FMC computed path when using LNAV guidance. This failure will also cause a flight director disagreement in LNAV mode. The flight director associated with the failed radio altimeter will be limited to 8 degrees of bank. The flight director associated with the operating radio altimeter will not be bank angle limited unless the airplane is below 400 feet AGL. If these effects occur, the flight crew must utilize other appropriate methods of flight path control at their disposal. These methods include but are not limited to: use of manual flight modes to keep the airplane on the FMC path or use of VOR guidance to track appropriate radials if the LNAV track overlays VOR airway structure. Additionally, the autopilot and flight director LNAV steering commands will be normal from the FCC associated with a functioning radio altimeter.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-14 R1 "In Effect" (IE).

This anomaly is corrected by Boeing Service Bulletin 737-SL-22-044. This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in the operator’s fleet have been modified.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-17 R1

IssueDate: November 6, 2000

Subject: Control Wheel Microphone/Interphone Switch Anomaly

Reason: To inform flight crews that the position of the Control Wheel Microphone/ Interphone switch can prevent PA announcements from the flight deck.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

An operator recently reported an anomaly while attempting a PA announcement using the audio panel PTT switch with the Control Wheel Microphone/Interphone switch latched in the INT (flight interphone) position. If the Control Wheel Microphone/Interphone switch is latched in the INT position and the associated audio panel PTT switch or hand microphone is used with the PA Transmitter Select switch selected, transmissions cannot be made on the PA system. The aft aisle PA handset or PA hand microphone continue to function normally in this condition. The other pilot's PTT switch and hand microphone operate normally if the associated Control Wheel Microphone/Interphone switch is not also latched in the INT position.

Boeing Service Bulletin 737-23-1157 provides information on the upgrade that fixes this anomaly.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-17 R1 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-23-1157. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-18 R2

IssueDate: November 1, 2001

Subject: Nuisance Zone Temp Light Illuminations on 737-800 Airplanes

Reason: To inform flight crews of operational issues associated with nuisance ZONE TEMP light illumination during preflight procedures.

The purpose of this reissue is to provide amplification of Normal Preflight and Shutdown procedures.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Many 737-800 operators have reported intermittent illumination of one, two or all three air conditioning system ZONE TEMP lights on the forward overhead panel during master caution recall. Subsequent maintenance interrogation of the pack/zone temperature controllers typically shows no faults or occasionally, trim air valve(s) faults. Resetting the master caution system extinguishes the ZONE TEMP light(s). A telex was sent to the operators that provides a workaround to prevent, or at least reduce the number of nuisance ZONE TEMP lights. This alternate procedure was coordinated with Service Engineering, Environmental Control Systems (ECS) Engineering and ECS vendor, Allied Signal.

The root cause of the problem has been associated with turning the Battery switch OFF while the Trim Air switches remain ON and ground power is applied to the airplane. With the Battery switch OFF, the Trim Air valves are not powered, and the Zone Temp Controllers remain powered. The result can be a ZONE TEMP light on master caution recall.

Service Bulletin 737-21-1133, to be released December 14, 2000, provides information for the hardware upgrade that fixes the ZONE TEMP light nuisance.

Operating Instructions

After landing, turn the Trim Air switches OFF prior to turning the Battery switch OFF during the Secure Procedure. Prior to Engine Start turn the Trim Air switches ON after turning the Battery switch ON (follow the normal Flight Deck Preparation - First Officer Procedure).

This procedure is temporary until system modifications are complete.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-18 R2 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-21-1133. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

Number: TBC-19

IssueDate: June 10, 1999

Subject: 737-600/-700/-800 Elevator Tab Operational Limitations

Reason: To inform flight crews of operational limitations associated with elevator tab inspection requirements.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

As a result of structural damage to an elevator tab rod fitting discovered on an in-service 737-800 airplane, the FAA has issued an Airworthiness Directive (AD) requiring operators to perform inspections and modifications of this part. The AD will require an operational limitation on certain 737-600/-700/-800 airplanes until inspections and modifications detailed in service bulletin SB 737-55A1068 are complete. This service bulletin calls for inspection within 10 days and has instructions for an interim fix and ongoing inspections.

Boeing analysis has confirmed that the damage was aggravated by speedbrake induced airframe vibrations. The severity of this vibration can be reduced by restricting the maximum airspeed with speedbrakes extended. Since this airspeed restriction adversely affects the airplane's ability to descend rapidly, the maximum cruise altitude must also be reduced to meet FAA emergency descent oxygen requirements.

The AD and this bulletin apply to airplanes with manufacturer's line numbers 1 through 190. Airplanes with service bulletin SB 737-55-1063 installed are not affected. Service bulletin SB 737-55-1063 calls for replacement of the tab mast fitting with a new part.

Operating Instructions

Do not operate airplanes affected by this bulletin at speeds in excess of 310 knots IAS with speedbrakes extended. Do not operate these airplanes above FL 390.

This procedure is required within 24 hours of AD release and is temporary until service bulletins SB 737-55A1068 or SB 737-55-1063 are complete.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-19 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by either Service Bulletin 737-55A1068 or 737-55-1063.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-20 R1

IssueDate: June 30, 2004

Subject: VHF Radio Use for ATC Ground Operations

Reason: To inform flight crews of the recommendation to use the VHF radio connected to the top of fuselage antenna for primary ATC communications on the ground.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

As a result of antenna location, several operators have reported blanking or inability to use the VHF radio connected to the bottom of fuselage antenna for Air Traffic Control (ATC) communications during ground operations at certain locations. The investigation of these reports indicated that blocking of the signal to the lower antenna caused the temporary loss of communications while on the ground. This blocking can be caused by the airplane not having line of sight to the tower due to the airplane fuselage, other airplanes or airport topography.

This issue will be addressed in a Federal Aviation Administration (FAA) Airworthiness Directive. Boeing has sent a telegraphic Service Letter to all operators and will create an Alert Service Bulletin to address retrofit of delivered airplanes. The Alert Service Bulletin is scheduled for release by second quarter 2000 and will direct the reconnection of the antennas to the following positions:

- VHF 1 to top center fuselage antenna
- VHF 2 to bottom aft fuselage antenna
- VHF 3, if installed, will remain in the bottom forward position.

In addition, Boeing is processing a change in production to reconnect the VHF antennas as described above.

Operating Instructions

Use the VHF radio connected to the top of fuselage antenna for primary ATC communications on the ground.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-20 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-23A1170. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your FCOM, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-21 R1

IssueDate: June 30, 2004

Subject: GPWS Minimums Voice Callout Anomaly

Reason: To inform flight crews of an anomaly in the DH/MDA voice callout functionality.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

The DH/MDA Callouts do not always function correctly on airplanes equipped with Look Ahead Terrain Alerting (GPWS). If the Minimums Reference Selector (MINS) on the EFIS Control Panel is rotated from BARO to RADIO below 1000 feet AGL, the callout may occur immediately and not at the appropriate altitude. This does not occur when the switch is rotated above 1000 feet AGL.

The Landing Altitude/Minimums Indications on the PFD display function correctly. These include the BARO Minimums Pointer and the Minimums Reference/Altitude.

Operating Instructions

Do not rotate the Minimums Reference Selector (MINS) on the EFIS Control Panel from BARO to RADIO once the airplane has descended below 1000 feet AGL.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-21 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-34-1616. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your FCOM, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin for The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-22 R1

IssueDate: June 30, 2004

Subject: TCAS Display Anomaly

Reason: To inform flight crews of a TCAS display anomaly.

The purpose of this reissue is to provide Service Bulletin information.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Flight testing and in-service experience has revealed anomalous TCAS display behavior for airplanes with TCAS MOPS 7 software installed. The problem is limited to the relative bearing display of TCAS "other traffic" beyond 40 NM from the airplane. TCAS "other traffic" is defined as non-threat traffic that is more than six miles laterally and 1200 feet vertically from the airplane. The following anomalies have been observed:

- The relative bearing of TCAS "other traffic" targets may be erroneous for targets beyond the 40 NM range.
- Relative bearing errors of TCAS "other traffic" targets may be as large as 180 degrees and the displayed bearing positions of these targets may change abruptly.
- Bearing errors for TCAS "other traffic" targets will increase as distance of traffic from the airplane increases, and are more pronounced at relative bearings of 360, 90, 180, and 270 degrees.

This problem does not affect relative bearing accuracy of TCAS targets that are less than 40 NM from the airplane. TCAS alerting and collision avoidance logic is not affected.

Operating Instructions

If a Traffic Advisory (TA) or Resolution Advisory (RA) occurs accomplish the published Traffic Avoidance procedure. Bearing information for TCAS traffic targets beyond 40 NM may not be accurate.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-22 R1 "In Effect" (IE).

This anomaly is corrected by Honeywell Service Bulletin 7517900-34-6005 or 7517900-34-6006 (TCAS computer update). This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in the operator’s fleet have been modified.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-23 R1

IssueDate: June 30, 2004

Subject: Look-Ahead Terrain Alerting Display Anomalies

Reason: To inform flight crews of display anomalies associated with GPWS look-ahead terrain alerting.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During a GPWS look-ahead terrain CAUTION or WARNING, terrain display data may be positioned inaccurately on the navigation display.

At ranges of 40 NM or greater, solid amber or solid red terrain data displays at an erroneous distance ahead of the airplane symbol. The error increases as the range selection is increased and can be up to 20 NM at the 160 NM range setting. Dotted red, dotted amber, and dotted green terrain data display correctly. Only solid amber (look-ahead terrain CAUTION active) and solid red terrain (look-ahead terrain WARNING active) data displays are affected.

In addition, display of solid amber and solid red terrain data may be delayed by 2 or 3 display sweeps after the initial terrain alert. Once displayed, solid terrain data may be removed on a subsequent display sweep.

Operating Instructions

The terrain data display is intended to serve as a situational awareness tool only. It does not provide the accuracy or fidelity on which to solely base terrain avoidance maneuvering decisions.

In the event of a look-ahead terrain CAUTION or WARNING, accomplish the appropriate Terrain Avoidance maneuver in the Non-Normal Maneuvers chapter of the QRH.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-23 R1 "In Effect" (IE).

This anomaly is corrected by Boeing Service Bulletin 737-34-1616. This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in the operator’s fleet have been modified.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-24

IssueDate: May 17, 2000

Subject: GPWS 2500 Foot Voice Callout Anomaly

Reason: To inform flight crews that the 2500 foot radio altitude voice callout may not occur.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During an approach over water the GPWS voice callout TWENTY FIVE HUNDRED may not occur. A recent change to the Collins LRA 900 radio altimeter introduced an anomaly that may prevent some radio altimeters from reporting the 2500 foot signal to the GPWS when flying over water due to temporarily high signal strength conditions.

This bulletin applies to airplanes equipped with faulty Collins LRA 900 radio altimeters (Part Number 822-0334-002).

Collins Service Bulletin No. 3 (LRA 900), dated April 7, 2000, provides information on the upgrade that corrects this anomaly. It is recommended that operators contact Collins directly.

Operating Instructions

Do not rely on the voice callout TWENTY FIVE HUNDRED during an approach over water.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-24 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes have been modified by Collins Service Bulletin No. 3.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-27 R1

IssueDate: June 30, 2004

Subject: PSEU Fault Indications

Reason: To inform flight crews of a configuration warning anomaly.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

There have been several cases of nuisance landing configuration warnings on BBJ airplanes when flaps are retracted after takeoff. This configuration warning is the result of a malfunctioning flap position switch (S138) in the Flap Control Unit.

An internal short in the S138 switch can initiate a landing configuration warning horn which will sound intermittently or continuously and cannot be silenced by the Landing Gear Warning Cutout Switch. Condition of the S138 switch is monitored by the Proximity Switch Electronics Unit (PSEU). Current PSEU logic incorrectly identifies this fault as a dispatchable condition. Detection of an internal short in the S138 switch on the ground results in a PSEU light which will illuminate on RECALL and extinguish during Master Caution system reset. Once airborne, the internal short causes an intermittent or continuous horn that can only be silenced by extending the flaps, lowering the landing gear, or pulling the Aural Warning circuit breaker.

Operating Instructions

Pulling the Aural Warning circuit breaker is not recommended as it disables other aural warning functions including the Autopilot Disconnect warning tone and the Cabin Altitude warning horn. Flight crews experiencing an inappropriate landing configuration warning should consider a return to landing as soon as flight conditions permit.

In addition, the PSEU Non Normal Checklist has been revised to remove the Master Caution system reset step. All PSEU light illuminations will require maintenance action prior to takeoff until further notice.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-27 R1 "In Effect" (IE).

This anomaly is corrected by Boeing Service Bulletin 737-32A1343. This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in the operator’s fleet have been modified.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-29 R2

IssueDate: July 19, 2002

Subject: Emergency Airworthiness Directive 2002-08-52

Reason: This bulletin notifies flight crews of an operation limitation associated with elevator control surface vibration on 737-600/-700/-700C/-800 and BBJ airplanes.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

In May 2001, a 737-800 airplane experienced a significant airplane vibration event associated with speed brake deployment as the airplane descended through flight level 220 at 320 knots IAS. Additionally, vibration events were experienced during the 737-900 flight test program that were attributed to a lack of sufficient damping necessary to prevent elevator tab vibration in certain flight conditions. The 737-900 elevator tab was stiffened to provide increased damping. Based on data gathered during the 737-900 flight test program, we believe it is likely that the 737-800 vibration event noted above was similar to these events.

Recently, a 737-700 airplane also experienced a similar vibration event associated with speedbrake deployment as the airplane descended through FL195 at an airspeed of 315 KIAS.

As a result an operational limitation as noted below has been expanded to include the 737-600/-700/-700C/BBJ airplanes until stiffened elevator tabs are installed. The new elevator tab will be incorporated in production at line number 1175, scheduled for delivery in July 2002. Retrofit of in-service airplanes per Boeing Service Bulletin 737-55A1080 will begin in the third quarter of 2002. Boeing anticipates this corrective action will provide sufficient damping to eliminate vibration. This limitation is identical to that currently in effect for 737-800 airplanes.

Operating Instructions

The following AFM limitation will be placed on the 737-600/-700/-700C/-800/BBJ fleet until terminated by the installation of a stiffened elevator tab:

Do not operate the airplane at speeds in excess of 300 KIAS with speedbrakes extended.

WARNING: Use of speedbrakes at speeds in excess of 320 KIAS could result in a severe vibration, which, in turn, could cause extreme damage to the horizontal stabilizer.

The FAA confirmed that in a situation requiring an Emergency Descent, the pilot in command may deviate from subject AD in accordance with the responsibility and authority provided in FAR 91.3.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-29 R2 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-55-1080.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-30 R1

IssueDate: June 30, 2004

Subject: Inflight Start EGT Display

Reason: To inform flight crews that the inflight start EGT start limit and exceedance indications may not appear correctly below 20,000 feet.

The purpose of this revision is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Exhaust Gas Temperature (EGT) is normally displayed on the center instrument panel upper display unit (DU) as both a digital readout and a round dial/moving pointer indication. Maximum operating limits are indicated by redlines.

The EGT Start Limit redline is displayed during engine start when N2 is less than idle. If an exceedance is noted by the electronic engine control (EEC), the digital readout, box, pointer and indicator change color to red.

Flight testing has shown that the Exhaust Gas Temperature (EGT) Start Limit redline and associated exceedance indications may not display during inflight engine starts below 20,000 feet due to an EEC software error. An EEC software update, due early first quarter 2002, will correct the anomaly.

Operating Instructions

Monitor EGT when performing the Inflight Engine Start procedure to ensure EGT does not rise rapidly or exceed the start limit of 725°C during the start attempt.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-30 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by CFM 56-7B Service Bulletin 73-0082.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company **Seattle, Washington 98124-2207** 737

Number: TBC-33 R1

IssueDate: November 1, 2002

Subject: Airworthiness Directive 2002-08-20, AMOC Letter 120S-02-907

Reason: This bulletin notifies flight crews of operational limitations and Non-Normal procedures associated with elevator control surface vibration (limit cycle oscillation) on the 737-600/-700/-700C/-800 and BBJ following deicing/anti-icing operations.

The purpose of this reissue is to provide flight crews with additional information from the Alternate Means of Compliance (AMOC) Letter 120S-02-907 which limits the restrictions to deicing/anti-icing with Type II or Type IV fluids.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports of incidents of severe airframe vibration (limit cycle oscillation) on 737-600/-700/-800 airplanes after the horizontal stabilizer had been deiced/anti-iced with Type II or Type IV fluids. These events have been attributed to accumulation of deicing/anti-icing fluid or other residue inside the elevator balance bay and on the exterior surfaces of the elevator tab. The accumulation of fluid in the balance bays has been attributed to inadequate drainage provisions. A previous Operations Manual Bulletin provided recommendations to the flight crew to help reduce accumulation of fluid in the elevator balance bays by ensuring the stabilizer is trimmed to the full APL NOSE DOWN position prior to any deicing/anti-icing operations, in accordance with the B737 Adverse Weather Supplementary Procedures. Following application of Type II or Type IV deicing/anti-icing fluid, the control column should be cycled slowly full forward to full aft a minimum of three times to help drain residual fluid from the elevator balance bay.

Boeing believes these limit cycle oscillation (LCO) events can be attributed to a lack of sufficient elevator tab damping to prevent elevator tab vibration in certain flight conditions. An elevator tab LCO is characterized by a high frequency (approximately 40 Hz) resonant vibration. This vibration originates, and is strongest, in the aft part of the airplane, but can be felt in the entire structure. It may or may not be felt in the control wheel. If the flight deck door is open, the vibration can be heard coming from the back of the airplane. In addition, aft cabin personnel will notice a strong vibration.

Operational limitations as noted below will be required for the 737-600/-700/ -700C/-800 and BBJ airplanes following any deicing/anti-icing with Type II or Type IV fluids until stiffened elevator tabs are installed. The new elevator tabs can be distinguished from the original tabs by the six-hinge design.

Flight test of the new tabs was completed in April 2002 and was incorporated in production at line number 1175 in July 2002. Retrofit of in-service airplanes per Boeing Service Bulletin 737-55A1080 began in September 2002. Boeing anticipates this corrective action will provide sufficient damping to eliminate vibration.

Service Bulletin 737-55A1084 was released to improve draining of fluid from the elevator balance bay area and to help reduce fluid accumulation. Service Letter 737-SL-55-021 was released to provide instructions to periodically clean the external surface of the elevator tab. Service Letter 737-SL-12-017 provided cleaning instructions for the elevator balance bays.

The effects of airframe vibration can be cumulative and can affect the life of the airframe. After completion of a flight during which a suspected ice-related airframe vibration is encountered, the flight crew is encouraged to complete a vibration report. An example of a flight deck vibration event log can be found in 737-SL-02-002-D, dated July 3, 2001.

Operating Instructions

After any ground deicing/anti-icing of the horizontal stabilizer using Type II or Type IV fluids, airspeed must be limited to 270 KIAS for all follow-on flights until the applicable maintenance procedures have been accomplished. Mach limits are not affected. Once the applicable maintenance procedures have been accomplished, exceeding 270 KIAS is permissible until the next application of Type II or Type IV deicing/anti-icing fluids.

These speed restrictions are not applicable if the horizontal stabilizer was deiced only, using hot water, Type I deicing fluid, or a mixture of hot water and Type I fluid. These speed restrictions are also not applicable if the horizontal stabilizer was deiced using mechanical or infrared means.

The speed restrictions and maintenance requirements remain in effect until the new stiffened elevator tabs are installed.

If a limit cycle oscillation (LCO) is suspected in flight for any reason, immediately reduce airspeed to 270 KIAS, or until the vibration ceases, whichever indicated airspeed is lower. Do not use speedbrakes or change configuration to reduce airspeed. Remain at or below the indicated airspeed at which the vibration ceased for the remainder of the flight, but do not exceed 270 KIAS. Do not use speedbrakes for the remainder of the flight. Evaluate the need to land at the nearest practicable airport. Landing airport selection should be based on all pertinent factors such as weather, distance to destination, range available at the reduced airspeed, maximum landing weight and possible airframe damage. Ground spoilers may be used for landing.

In a situation requiring an Emergency Descent, the pilot in command may deviate from the 270 KIAS airspeed restriction and may use speedbrakes as required. If structural integrity is in doubt, limit speed as much as possible and avoid high maneuvering loads.

In the event a non-normal procedure must be performed that requires a higher airspeed (e.g., PACK/PACK TRIP OFF, etc.) the pilot in command may deviate from the 270 KIAS airspeed restriction as necessary to comply with the non-normal checklist.

Flight Crew Operations Manual Information

The following information will be included in the Limitations chapter of your Volume 1 in the next revision of the Operations Manual. This information will also be added to the Limitations chapter of the Airplane Flight Manual.

After ground deicing/anti-icing of the horizontal stabilizer using Type II or Type IV fluids, airspeed must be limited to 270 KIAS until the flight crew has been informed that applicable maintenance procedures have been accomplished that would allow exceedance of 270 KIAS. Once the applicable maintenance procedures have been accomplished, exceeding 270 KIAS is permissible until the next application of Type II or Type IV deicing/anti-icing fluids.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-33 R1 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-55A1080.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Intentionally
Blank

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-34

IssueDate: August 2, 2002

Subject: FMC MAP Display Blanking with FMC Update U10.3, U10.4 and U10.4A software

Reason: This bulletin notifies flight crews that FMC MAP display blanking has been experienced on 737 airplanes with FMC Update U10.3, U10.4 and U10.4A software installed.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Since January 2002, several operators with FMC U10.3, U10.4 and U10.4A software installed on their 737 airplanes have reported blanking of the FMC MAP display during approach at a limited number of airports. These MAP blanking events appear to occur without pilot action and are unrecoverable by manual switching.

There have also been reports of MAP RANGE DISAGREE and MAP FAIL anomalies induced when mode/range changes are made on the EFIS control panel during approach. These failures affect one or both MAP displays. The majority of these events have been recoverable.

The FMC U10.5 software upgrade scheduled for third quarter/early fourth quarter 2002 is expected to correct both of these anomalies.

Operating Instructions

Minimize MAP mode/range changes during approach with FMC Update U10.3, U10.4 or U10.4A software installed. If unrecoverable MAP display blanking occurs, use the other pilot's MAP display and/or conventional means of navigation and land as soon as practicable. After landing, have maintenance recycle power to the FMC.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-34 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been updated to FMC Update U10.5 software.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-35 R1

IssueDate: July 14, 2004

Subject: Integrated Standby Flight Display (ISFD) Alignment Anomaly

Reason: To inform flight crews of an ISFD anomaly and provide corrective action.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports of incorrect attitude on the Integrated Standby Flight Display (ISFD). Subsequent investigation has found that improper alignment of the ISFD can cause attitude display anomalies. The display anomaly shows after takeoff as an obvious error in pitch and/or roll.

The Integrated Standby Flight Display (ISFD) performs a two-minute alignment immediately after the Battery switch has been positioned ON. Any change in airplane position during this alignment period may result in inaccurate attitude information not annunciated to the flight crew. The anomaly is not detectable by ISFD internal monitoring and may not show an obvious error in roll and/or pitch indications when compared to the pilots' primary flight instruments during preflight. Gust effects or movement of cabin occupants during the ISFD alignment period will not cause the anomaly.

Re-alignment can only be accomplished by cycling electrical power to the ISFD while the airplane is on the ground. This can be accomplished by removing all airplane electrical power or by an approved maintenance procedure.

The RST switch on the ISFD does not correct for inaccuracies introduced by airplane movement during the alignment process. It should only be pushed in response to the ATT:RST amber message.

Operating Instructions

An airplane Flight Manual (AFM) Limitation will be published that states:

INTEGRATED STANDBY FLIGHT DISPLAY (IF INSTALLED)

The Flight Crew must verify the airplane was not moved during Integrated Standby Flight Display alignment. If unable to verify, then the power up alignment process must be reinitialized and completed prior to flight."

To comply with the AFM limitation, the airline must have procedures in place to assure flight crews on the first flight of the day, crew change, or after any complete airplane power down, that ISFD alignment was completed before the airplane was moved.

The following note will be added to the Flight Deck Safety Inspection – Captain or First Officer normal procedure:

Battery Switch .... ON

Guard – Down

Note: Do not move the airplane until ISFD alignment is complete.

The following will be included in the Flight Deck Preparation – Captain normal procedure:

Integrated Standby Flight Display ....Check

Approach Mode Display – Blank

Set local altimeter setting

Verify flight instrument indications are correct

Verify no flags or messages are displayed.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-35 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-34-1720.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-37

IssueDate: September 16, 2002

Subject: AD-2002-19-51, Flight Control Modules

Reason: This bulletin informs flight crews of the potential for failure of a flight control module. This bulletin also provides operating instructions for flight crews.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Flight control module failures have been reported on 737-600/-700/-700C/-800/-900/BBJ airplanes since June 2002. The majority of the failures have occurred during preflight checks prior to delivery acceptance test flights, but failures have also been reported on four in-service airplanes. Discussions with the supplier indicate the potential for this condition is most likely isolated to Flight Control Module Part Number 65-44891-7, Serial Numbers 8726 through 8936, installed on airplanes delivered after May 21, 2002. The FAA has issued Emergency Telegraphic AD 2002-19-51 to address required operator action.

There are two identical flight control modules on each airplane. Each module controls hydraulic fluid distribution from its respective hydraulic system to the aileron, elevator and rudder. The failure mode is a partial or complete blockage in the return passage of the module resulting in inadequate differential pressure available to flight control power control actuators (ailerons, elevators, rudder). Failure of one flight control module in flight may result in an increase in flight control forces. Failure of a second flight control module could result in serious degradation of airplane controllability, including high control forces.

Because the blockage is in the return passage, the associated Flight Control LOW PRESSURE Light remains extinguished for the affected flight control module. The Hydraulic LOW PRESSURE Light also remains extinguished. The most likely flight deck indication is failure of both Autopilot A and B to engage. Other indications include possible increase in flight control forces (similar to manual reversion) and possible yaw damper disengagement.

Airplanes with two suspect modules are not to be flown until at least one non-suspect module has been installed.

In order to help identify a flight control module failure prior to flight, Boeing has developed Flight Control and Autopilot preflight checks to be performed on airplanes with a suspect flight control module installed. These checks can be performed anytime after the Electric Hydraulic Pump A and B Switches are positioned ON and prior to Engine Start. If MEL dispatch with one or both autopilot channels inoperative is planned, it is acceptable not to perform the Autopilot check on the inoperative channel(s).

If it is determined that a flight control module has failed, subsequent flights must not be made until the failed module has been removed and replaced.

Operating Instructions

Preflight Check:

The following Flight Control and Autopilot checks must be performed prior to each flight on an airplane with a suspect flight control module installed. These checks can be performed anytime after the Electric Hydraulic Pump A and B Switches are positioned ON and prior to Engine Start. Ensure ground personnel are clear of all control surfaces.

Note: These checks are only designed to detect a failed flight control module.

Flight Control Check

1. Ensure FLT CONTROL A & B Switches are ON
2. FLT CONTROL A Switch . . . . OFF
   - Verify Flight Control LOW PRESSURE Light illuminates within 2 seconds
3. FLT CONTROL A Switch . . . . ON
   - Verify Flight Control LOW PRESSURE Light extinguishes
4. FLT CONTROL B Switch . . . . OFF
   - Verify Flight Control LOW PRESSURE Light illuminates within 2 seconds
5. FLT CONTROL B Switch . . . . ON

Autopilot Check

If MEL dispatch with one or both autopilot channels inoperative is planned, it is acceptable not to perform the Autopilot check on the inoperative channel(s).

1. Ensure both IRUs are in the NAV Mode
2. A/P ENGAGE Switch . . . . CMD A
   • Wait 10 seconds and verify autopilot CMD mode engages
3. Disengage Autopilot A
4. A/P ENGAGE Switch . . . . CMD B
   • Wait 10 seconds and verify autopilot CMD mode engages
5. Disengage Autopilot B
6. To fail this test, one autopilot will fail to engage and the other will fail to remain engaged

Note: Failure of the autopilots to engage as described in Step 6 may indicate a failure of a flight control module.

Note: If either Flight Control Module Preflight Check fails, do not takeoff until the failed module has been replaced.

In-flight Failure

Failure of both Autopilot A and B to engage may indicate a failure of the module in flight. Other indications include possible increase in flight control forces (similar to manual reversion) and possible yaw damper disengagement.

Failure of a second flight control module in flight could result in serious degradation of airplane controllability, including high control forces. If a failure is suspected in flight:

- Plan to land at the nearest suitable airport
- Crosswind capability may be reduced
- Do not turn off any Flight Control Switches
- Plan a flaps 15 landing
- Use VREF 15 + 5 or VREF ICE + 5
- Place the GROUND PROXIMITY FLAP INHIBIT Switch to FLAP INHIBIT

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-37 "In Effect" (IE).

This bulletin will be cancelled after Boeing has been notified that no suspect flight control modules are installed in any airplanes in your fleet.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-38 R1

IssueDate: November 1, 2004

Subject: Flight Director and Autopilot Mode Entry Failures

Reason: This bulletin informs flight crews of flight director and autopilot anomalies that may be seen on airplanes equipped with the Collins Enhanced Digital Flight Control System (EDFCS).

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports of failure of the flight director (F/D) to enter takeoff mode and failure of the autopilot and flight director to enter pitch cruise modes on airplanes equipped with the Collins Enhanced Digital Flight Control System (EDFCS).

In certain scenarios, an error in the Collins FCC software may leave the glide slope engage logic set internally in either FCC without a corresponding G/S flight mode annunciation (FMA) on that side. This will cause the F/D takeoff mode and some autopilot or F/D pitch cruise modes to be inhibited.

This condition may also occur when an autopilot or F/D approach is discontinued using means other than autopilot or F/D go-around.

This anomaly will be corrected in a future FCC software upgrade.

Operating Instructions

Prior to takeoff, turn both flight director (F/D) switches OFF. Cycle F/D A ON then OFF. Cycle F/D B ON then OFF. At the completion of these steps, resume normal AFDS operations. This procedure should be accomplished whether the F/Ds are used for takeoff or not.

If an ILS approach is exited after G/S capture by means other than using the TO/GA switch, turn the autopilot and both F/D switches OFF. Cycle F/D A ON then OFF. Cycle F/D B ON then OFF. At the completion of these steps, resume normal AFDS operations.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-38 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-22A1164. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your FCOM, please advise Boeing accordingly.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-39 R1

IssueDate: November 1, 2004

Subject: Autopilot Altitude Acquire/Altitude Capture Anomaly

Reason: This bulletin informs flight crews of an anomaly reported in the Collins Enhanced Digital Flight Control System (EDFCS).

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received a report of excessive pitch up and speed loss on an airplane equipped with the Collins Enhanced Digital Flight Control System (EDFCS) after selection of a new MCP altitude during an autopilot Altitude Acquire (ALT ACQ) maneuver.

Normally, if a new altitude is selected while in ALT ACQ, the Flight Control Computer (FCC) will automatically transition to vertical speed (V/S), synchronizing to the existing airplane vertical speed. If the selection is made after transition to Altitude Hold (ALT HLD), the FCC will remain in ALT HLD at the previously selected altitude.

It has been determined that if a new altitude selection is made when the FCC is in the final transition between ALT ACQ and ALT HLD (within a 200 msec window), an altitude somewhere between the previously selected MCP altitude and the new MCP altitude will be stored as the reference ALT HLD altitude. The FCC will command a pitch maneuver in the direction of this new altitude. This new pitch command may be excessive and if the autopilot is engaged, may require flight crew intervention to return the airplane to a normal flight path.

This anomaly will be corrected in a future FCC software upgrade.

Operating Instructions

If the MCP altitude is adjusted during ALT ACQ or when ALT HLD is first displayed, monitor autopilot and flight director commands. The autopilot or flight director should transition to V/S or continue to level in ALT HLD at the previously selected altitude. If autopilot or flight director pitch commands are excessive, ensure proper flight path control and select a new pitch mode if required.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-39 R1 "In Effect" (IE).

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-41 R1

IssueDate: November 1, 2004

Subject: Target Speed Anomaly with Flaps Extended and VNAV Engaged

Reason: This bulletin informs flight crews of target speed anomalies on airplanes equipped with the Collins Enhanced Digital Flight Control System (EDFCS) when flaps are extended and operating in VNAV.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports of target speed anomalies with flaps extended when operating in VNAV during approach. The anomaly may occur at any flap setting from Flaps 2 to Flaps 40, but the discrepancy is most likely to occur at Flaps 15 due to system tolerances.

The Flight Management Computer (FMC) uses flap position data as output by the Flight Control Computer (FCC). Due to an implementation error in the Collins Enhanced Digital Flight Controls System (EDFCS), the FCC sends uncorrected flap position data rather than adjusted data. The FMC switches to the next higher flap setting when it receives a signal that the flap position has increased more than 0.5 degrees above the selected flap detent. With the flap handle at Flaps 15, the uncorrected flap position data may be as high as 19.5 degrees depending on airplane installation and tolerances. Similar differences between uncorrected and adjusted data exist for other flap settings, but the system tolerances are much smaller. As a result, the anomaly is less likely to occur at flap settings other than Flaps 15.

When Flaps 15 is selected, the target speed initially indicates the correct airspeed for the flap setting as the flaps transition from 10.5 to 15 degrees. If the tolerances at this flap setting result in an uncorrected output greater than 15.5 degrees, the target speed (magenta bug) may reduce to a speed consistent with Flaps 25 and the autothrottles will adjust to capture this lower speed. This results in the aircraft slowing to near minimum maneuver speed for Flaps 15.

When flying a VNAV approach on airplanes equipped with speed intervention (SPD INTV), the flight crew should select SPD INTV prior to the initial flap selection and manually set the correct flap speed on the MCP. The autothrottles will adjust to capture the MCP speed. SPD INTV should be used for the duration of the approach.

On airplanes without speed intervention, VNAV must be disengaged and the approach flown in another mode if the anomaly is observed. When landing flaps are selected, VNAV may be re-engaged.

On airplanes equipped with the Head-Up Display (HUD), the AOA approach band may not be correctly displayed with Flaps 15 selected. When Flaps 30 or 40 have been selected, the AOA approach band will be correctly displayed on the HUD.

This anomaly will be corrected in a future FCC software upgrade targeted for early 2004.

Operating Instructions

When flying VNAV approaches on airplanes equipped with speed intervention (SPD INTV), select SPD INTV prior to the initial flap selection and manually select the correct speed on the MCP. Remain in SPD INTV for the duration of the approach.

On airplanes without speed intervention, disengage VNAV and fly the approach in another mode if the anomaly is observed. When landing flaps are selected, VNAV may be re-engaged.

On airplanes equipped with HUD, if the AOA approach band is not correctly displayed at Flaps 15, do not use this information.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-41 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-22A1164. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your FCOM, please advise Boeing accordingly.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-42 R2

IssueDate: November 1, 2004

Subject: FMC Navigation Anomaly

Reason: This bulletin informs flight crews of an FMC navigation anomaly on airplanes equipped with dual FMCs and FMC Updates U10.3, U10.4, U10.4a or U10.5.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports of FMC map shifts on 737-400 airplanes equipped with dual FMCs and FMC Update U10.4a. The root cause of the problem has not been determined, but Boeing and Smiths Industries believe the anomaly may be possible on all 737 airplanes with dual FMCs and FMC Updates U10.3, U10.4, U10.4a or U10.5. The problem can occur on both GPS and non-GPS equipped airplanes.

Each of the reported map shifts was accompanied by a “VERIFY POSITION” alert message and a displayed ACTUAL navigation performance value that was less than the RNP value. In these events, the “VERIFY POSITION” message indicated an actual FMC position error.

The “VERIFY POSITION” message is triggered by differences in FMC and/or sensor positions and RNP. The “UNABLE REQD NAV PERF - RNP” message is generated when ACTUAL navigation performance does not satisfy the RNP criteria. POS SHIFT page 3/3 provides the relative FMC, GPS (if installed), IRS and RADIO positions, as well as RNP and ACTUAL navigation performance.

For at least one of the reported events, map shifts occurred on both displays due to the FMC position aligning with the average IRS position. Each FMC's internal position then reverted to its onside IRS position. When the FMC positions exceeded the RNP criteria, the “VERIFY POSITION” message was triggered.

The ACTUAL navigation performance computation did not reflect the FMC reversion to inertial only operation. Since the computed ACTUAL navigation performance was based on the available, but unused, radio and GPS position data, it was less than the RNP, and the “UNABLE REQD NAV PERF - RNP” message was not displayed.

If the FMC Source Select Switch is positioned to BOTH ON L or BOTH ON R (i.e., equivalent to single FMC operation), the FMC position is updated from available onside sensors with the correct ACTUAL navigation performance. The “VERIFY POSITION” message will then clear if the resulting FMC position is within the RNP. With the anomaly present, the problem will recur when the FMCs are switched back to NORMAL (dual FMC operation) and the “VERIFY POSITION” message will again be displayed.

Whenever flight crews encounter a “VERIFY POSITION” message, the message should not be manually cleared from the FMC scratchpad. If the message appeared shortly after manually entering an approach RNP of 0.2 NM or less while in cruise, or during descent above 15,000 feet, the message may be due to delays in sensor updating rather than an FMC navigation anomaly. If there is no FMC anomaly, the message will self-clear after the airplane is slowed below approximately 250 knots.

However, an anomaly is indicated if the “VERIFY POSITION” message is displayed during either of the following conditions:

- within 60 seconds after descending through 15,000 feet (terminal navigation environment, default RNP = 1.0 NM), or
- within 10 seconds after passing within two NM of the initial approach fix (approach navigation environment, default RNP = 0.5 NM or with the NPS option, default RNP = 0.3 NM).

In the event of an FMC navigation anomaly, RNAV (RNP) operations should not be conducted while the “VERIFY POSITION” message is displayed. The FMC Source Select Switch should be positioned to BOTH ON L or BOTH ON R to cause the FMC to return to updating from available onside sensors. The FMC Source Select Switch should remain in the selected position for the remainder of the flight to prevent the anomaly from recurring.

After landing, a long-term power interrupt of 15 seconds or longer will be necessary to at least one FMC to clear the anomalies. This can be accomplished by removing all airplane electrical power or by an approved maintenance procedure.

This problem remains under investigation. Boeing and Smiths Industries are evaluating the need for an intermediate FMC Update (U10.5a) that would be targeted for second quarter 2004.

Operating Instructions

If the “VERIFY POSITION” message appears, do not clear the message from the FMC scratchpad. Do not conduct RNAV (RNP) operations while the message is displayed.

If the “VERIFY POSITION” message appears shortly after manually entering an approach RNP of 0.2 NM or less while in cruise or during descent above 15,000 feet, slow the airplane to 250 knots or less. If the message is due to delays in sensor updating the message will self-clear.

If the “VERIFY POSITION” message is displayed when descending through 15,000 feet, or after passing within two NM of the initial approach fix, position the FMC Source Select Switch to BOTH ON L or BOTH ON R for the remainder of the flight.

After landing, a long-term power interrupt (15 seconds or longer) must be performed on at least one FMC to clear the anomalies.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-42 R2 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-34A1801. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your FCOM, please advise Boeing accordingly.

Number: TBC-44 R1

IssueDate: October 21, 2005

Subject: Flight Director Anomaly

Reason: This bulletin informs flight crews of a Flight Director anomaly during Flight Director Takeoffs on airplanes equipped with the Collins Enhanced Digital Flight Control System (EDFCS).

The purpose of this reissue is to provide Service Letter information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has discovered a flight director anomaly on airplanes equipped with the Collins Enhanced Digital Flight Control System (EDFCS). The anomaly may occur if the TO/GA switch is pressed a second time after liftoff while the flight director is already in takeoff mode. This anomaly only occurs during a flight director takeoff. Go-around mode is not affected, nor is operation with the autopilot engaged.

If LNAV has been selected prior to takeoff and a TO/GA switch has been pushed, pushing a TO/GA switch a second time after liftoff results in loss of flight director roll guidance and roll mode annunciation. Flight director roll guidance will be removed from view on those airplanes equipped with the split axis flight director and both pitch and roll flight director guidance will be removed from view on those airplanes equipped with the integrated cue flight director. This anomaly will occur any time the airplane is in takeoff mode, regardless of altitude. LNAV or another roll mode can be re-selected at any time above 400 feet AGL and the correct flight director information will be displayed.

In addition, on those airplanes with the Heading Select-on-Takeoff option, pushing a TO/GA switch a second time while in Takeoff Heading Select mode above 400 feet AGL, will also result in loss of flight director roll guidance and roll mode annunciation. The flight director bar(s) will be removed from view. The correct flight director information will be displayed after re-selecting a roll mode.

This anomaly is present on all airplanes equipped with the Collins EDFCS, regardless of software load (i.e., P1.1 or P2.0). It will be corrected in a future FCC software upgrade targeted for first quarter 2005.

Operating Instructions

If roll mode annunciation and flight director guidance (roll, or pitch and roll) is lost following a second push of a TO/GA switch, reselect the appropriate roll mode when above 400 feet AGL.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-44 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Letter 737-SL-22-056-B.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

BOEING

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company

Number: TBC-45 R4

IssueDate: December 7, 2023

Subject: Predictive Windshear System Anomaly

Reason: This bulletin informs flight crews of the susceptibility of certain airports to false Predictive Windshear System (PWS) alerts.

This bulletin is being revised to update the list of affected airport/runway combinations.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Airlines have reported false Predictive Windshear System (PWS) alerts at a number of airports. The anomaly is only applicable to PWS alerts; all reactive windshear alerts which occur are valid. These false alerts are limited to airplanes equipped with the Honeywell weather radar with the following PWS weather radar processor part numbers:

- 066-50008-0406 (All listed airports)
- 066-50008-0408 (All listed airports)
- 930-1000-001 (SBRJ airport only)
- 930-1000-002 (SBRJ airport only)
- 930-1000-003 (SBRJ airport only)

Honeywell has reviewed data provided by the affected airlines and has attempted to determine if particular airports and runways may be susceptible to “false alerts”. In addition, data have been analyzed to determine if the alerts are more likely during takeoff or on approach.

Honeywell has accumulated sufficient data to suggest that the following airport/runway combinations are susceptible to false PWS alerts:

- EHAM (Amsterdam), Runway 9, Takeoff
- GCRR (Lanzerote), Runway 3, Approach
- KBOS (Boston), Runway 27, Approach
- KOAK (Oakland), Runway 29, Approach
- KPHL (Philadelphia), Runway 35, Approach
- KSNA (John Wayne Orange County), Runway 19R, Approach
- KSTL (St. Louis), Runway 12 (L and R), Approach
- LEBL (Barcelona), Runway 25, Approach
- LFMN (Nice), Runway 4L, Approach
- LGSR (Santorini), Runway 34R, Approach
- LGTS (Thessaloniki), Runway 10, Approach
- RJTT (Tokyo, Haneda), Runways 16 and 22, Approach
- RKPK (Busan, Gimhae), Runways 36L and 36R, Takeoff
- RKSI (Seoul, Incheon), Runway 33R, Approach
- SBRJ (Rio de Janeiro), Runway 20L, Approach

Although these particular airports appear to be more susceptible to false alerts, the data indicates the majority of operations at these airports do not experience false PWS alerts.

Flight crews should use the following criteria to help determine if windshear exists:

- reports of windshear from other aircraft
- visual indications
- tower windshear alerts
- differences between computed winds in the airplane and reported winds from the tower.

Honeywell has developed software modifications that should significantly reduce the occurrences of false PWS alerts. These modifications also include numerous other changes and enhancements. Service Letters 737-SL-34-188 and 737-SL-34-189 provide additional information about these changes.

As Honeywell continues to develop a software solution and to process data, operators are encouraged to continue reporting incidents to Honeywell and Boeing in order to provide the most effective solution possible to this anomaly.

Operating Instructions

If windshear is encountered, perform the Windshear Escape Maneuver.

It is recommended operators establish policies for flight crews operating into one of the suspect airport/runway combinations in the event a PWS alert occurs. The following windshear criteria may be beneficial in establishing policies:

- reports of windshear from other aircraft
- visual indications
- tower windshear alerts
- differences between computed winds in the airplane and reported winds from the tower.

The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-46 R1

IssueDate: November 1, 2004

Subject: FMC Arc Leg Sequencing Anomaly

Reason: This bulletin informs flight crews of a problem reported in the U10 series FMC.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has recently discovered a FMC U10 Series problem associated with sequencing waypoints with either DME Arcs to a Fix (AF legs) or Constant Radius to a Fix (RF legs). This problem only can occur if two sequential AF legs are in the route whereas this problem may occur with only one RF leg in the route.

An AF leg or RF leg is used to create an arcing route between waypoints. On the LEGS page, arc legs are identified by title containing the arc distance in nautical miles (7.3) followed by the letter L (left) or R (right), for example 7.3 L or 10.4 R. Examples of sequential DME arcs can be found on Jeppesen charts for KYKM, Yakima Washington USA, 13-1, VOR DME or GPS Rwy 27; MGGT, Guatemala, 11-3, ILS DME Arc Rwy 01; EGBB, Birmingham, UK, 11-1, ILS DME Rwy 15. The recommended method of identifying routes with DME arcs is to use the published charts as well as the FMC LEGS page.

RF legs are only used by a few operators who have tailored navigation databases associated with very low RNP operations.

If this problem occurs, the FMC does not properly sequence the waypoint at the termination of the arc and continues to provide lateral guidance commands to continue flying the arc radius. The route shown on the HSI map is not changed and appears normal but the airplane will begin deviating from the magenta flight path since lateral guidance continues to follow the arc radius. Lab testing indicates that during this condition, LNAV will remain engaged. If Navigation Performance Scales (NPS) are installed, they provide an erroneous display of flight technical error because lateral deviation is based on continuing to follow the arc rather than the displayed magenta path. This problem has been reported during a non-revenue flight test and during flight simulator testing. Boeing is not aware of any in-service reports of this problem.

A remedy for this problem is planned to be incorporated in the next FMC software update, U10.5A. As a result, we plan to delay the previously scheduled certification date of U10.5A from May 2004 to approximately June 2004.

Operating Instructions

Boeing recommends that in either IMC or VMC conditions, flight crews monitor routes with DME arcs (AF legs) to insure the airplane follows the published route. Until a remedy has been incorporated, we recommend flight crews not use Constant Radius Arcs (RF legs) unless in VMC.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-46 R1 "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin 737-34A1801 which installs FMC Update U10.5A or when Boeing is notified that a later software version has been installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin

The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-47

IssueDate: May 24, 2004

Subject: Lack of "GLIDESLOPE" Alert During Approach

Reason: This bulletin informs flight crews the “GLIDESLOPE” alert will not sound if the airplane deviates below the glideslope or glide path in certain conditions.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has discovered the Mode 5 “GLIDESLOPE” alert will not sound on airplanes equipped with the Integrated Approach Navigation (IAN) option or the GPS Landing System (GLS) option in certain approach conditions.

Normally, the alert will sound if a glideslope or glide path capable approach is selected, the airplane is established on the glideslope or glide path below 1000 feet radio altitude, and the airplane then deviates more than 1.3 dots below the vertical path. The Enhanced Ground Proximity Warning System (EGPWS) monitors deviation data from both Multi-Mode Receivers (MMR) or Flight Management Computers (FMC).

Due to an implementation error, the EGPWS on airplanes with IAN or GLS monitors deviation data from the left MMR or left FMC only. If the right VHF navigation radio is appropriately tuned for the approach but the left VHF navigation radio is not tuned for the approach, the “GLIDESLOPE” alert will not sound if the airplane deviates below the glideslope or glide path. This anomaly will be corrected in a future software upgrade.

Operating Instructions

During an approach that uses a ground based navigation radio signal for either or both vertical guidance (G/S) or lateral guidance (VOR/LOC or BCRS), ensure the left VHF navigation radio is tuned appropriately for the approach being flown and the approach information is shown on the captain's display.

Affected flight modes are:

- ILS - VOR/LOC and G/S
- ILS with G/S selected OFF, LOC, LDA or SDF - VOR/LOC and G/P
- Localizer back course - BCRS and G/P
- GLS - VOR/LOC and G/S

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-47 "In Effect" (IE).

This FCOM bulletin will be revised to include Service Bulletin information when available.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-48 R1

IssueDate: April 3, 2007

Subject: Center Tank Fuel System Changes

Reason: This bulletin provides information about center tank fuel system changes for 737-600/-700/-800/-900 airplanes.

The purpose of this revision is to provide visibility for the fuel usage procedures contained in the Flight Crew Operations Manual (FCOM) Normal Procedures.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing introduced center tank fuel system changes in production, at Production Line Number 1494 and on, with deliveries starting in May 2004. These revisions included a Master Caution system logic change, center tank fuel pump auto shutoff and CONFIG alert logic change. These system updates were made available for post-production retrofit via Boeing Service Bulletin 737-28A1206, dated 11 January 2006.

The Master Caution system logic has been revised so the Master Caution lights and the FUEL system annunciator light illuminate when either center tank fuel pump indicates low pressure, as opposed to the original Master Caution system logic that requires both center tank fuel pumps to indicate low pressure before the Master Caution lights and the FUEL system annunciator light illuminate. As a result of this system logic change, Master Caution light recall will no longer cause the Master Caution and FUEL annunciator lights to illuminate if one center tank fuel pump switch is positioned OFF and the other is positioned ON.

To limit the potential for prolonged dry running of the center tank fuel pumps, a Center Tank Boost Pump Auto Shutoff system has been installed to automatically turn the affected center tank fuel pump off after 15 seconds of continuous low fuel pressure indication. The center tank fuel pump switch will remain in the ON position and LOW PRESSURE will be illuminated until the flight crew positions the fuel pump switch to OFF. The auto shutoff feature will individually control the center tank fuel pumps and can be manually reset by turning the respective center tank fuel pump switch OFF, then ON. If no fuel is available, the pump will again turn off after 15 seconds of continuous low pressure. This system is intended to be a backup to normal flight crew procedures.

The CONFIG alert logic has been changed so that the alert is illuminated when center tank quantity is greater than 1600 pounds/726 kilograms, either engine is running and both center tank fuel pump switches are positioned OFF.

As a result of these changes, new normal procedures were developed for airplanes with the center tank fuel system changes installed. However, operators may continue to use the procedures contained in AD 2002-19-52 and AD 2002-24-51, or the procedures approved in FAA Approval Letter 140S-03-189 as an Alternative Method of Compliance (AMOC), until all center tank fuel pumps have been inspected and all airplanes in their fleet have been modified. All three fuel usage procedures have been incorporated into the Before Takeoff, Climb and Cruise, and Descent Procedures in the Flight Crew Operations Manual (FCOM).

A step was added to the Before Start Procedure for all operators to ensure the integrity of the pressure sensor and indication system of the center tank fuel pumps. Flight crews are directed to turn the left and right center tank fuel pump switches to ON if the center fuel tank contains more than 1000 pounds/453 kilograms. The crew should verify the amber LOW PRESSURE lights illuminate momentarily and then extinguish. If an amber light remains illuminated, the associated center tank fuel pump switch must be turned OFF. These procedures are applicable to all airplanes, regardless of which of the three fuel usage procedures have been adopted.

Flight crews should be aware when flying airplanes equipped with the auto shutoff system that it is possible for the center tank pump inlets to be uncovered long enough to trigger the auto shutoff system while in climb, descent, acceleration, deceleration, or during maneuvers when the center tank fuel quantity is low but the tank not empty. If this occurs, the affected center tank fuel pump(s) should be selected OFF when the center tank fuel pump LOW PRESSURE light illuminates. Per the normal procedures, once the airplane is in level flight, with fuel remaining in the center tank, the center tank fuel pump(s) should be selected ON again. When the center tank fuel pump LOW PRESSURE light(s) once again illuminates, the pump(s) should be selected OFF.

Operating Instructions

Refer to the FCOM Normal Procedures for fuel usage procedures for Before Start, Before Takeoff, Climb and Cruise, and Descent.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-48 R1 "In Effect" (IE).

This bulletin will be cancelled in a future revision of the FCOM.

737

Number: TBC-50 R2

IssueDate: March 18, 2021

Airplane Effectivity: 737-600/-700/-800/-900 with Stall Management Yaw Damper (SMYD) Computer 285A1010-6/-106 and Older.

Subject: Nuisance Stall Warning Stick Shaker Events

Reason: This bulletin provides information about nuisance stall warning stick shaker events experienced on 737-600/700/800/900 airplanes.

This bulletin is being revised to add airplane effectivity and to provide cancellation information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

A nuisance stall warning stick shaker event is one in which the stick shaker activates although the airplane is not near a stall condition. In-service incidents have revealed corners of the operating envelope where turbulence or additional maneuver loads can result in momentary nuisance stick shaker events. Boeing has determined the following flight conditions can lead to nuisance stick shaker events:

1. Encountering moderate to severe turbulence when operating at or near the Maximum Operating Altitude.
2. Maneuvering during flap retraction from Flaps 1 to Flaps Up after takeoff or during a missed approach when Engine Anti-Ice is ON or when Wing Anti-Ice has been selected ON after liftoff.
3. Maneuvering at V2 speed following an engine failure on takeoff when Wing Anti-Ice has been selected ON after liftoff.

Boeing is investigating design changes to the Stall Management/Yaw Damper (SMYD) computer logic to minimize the frequency of these events.

Operating Instructions

Scenario 1: Moderate to severe turbulence is encountered when operating at or near the Maximum Operating Altitude.

Crew Action:

No change in operations is required. Flight crews should be aware stall warning stick shaker events have occurred in moderate turbulence, particularly when flying near the lower amber band when at or near maximum operating altitudes.

Scenario 2: After takeoff or missed approach, the airplane is maneuvered during flap retraction from Flaps 1 to Flaps Up with Engine Anti-Ice ON or Wing Anti-Ice selected ON after liftoff.

Crew Action:

During flap retraction from Flaps 1 to Flaps Up, limit bank angle to 15 degrees and avoid higher maneuver loading of the aircraft until the Leading Edge Flaps Transit light has extinguished. If a higher bank angle is required during this time, avoid the selection of Flaps 1 to Flaps Up until maneuvering is complete or bank angles are 15 degrees or less.

Note: A non-maneuvering segment of approximately 1 nm during all-engine operations or approximately 2.5 nm for an engine-out operation will allow for flaps to be retracted from Flaps 1 to Flaps Up.

Scenario 3: The airplane is maneuvered at V2 speed following an engine failure on takeoff when Wing Anti Ice has been selected ON after liftoff.

Crew Action:

Do not turn Wing Anti-Ice ON until airspeed has increased to at least V2+15 knots.

Administrative Information

This bulletin replaces bulletin TBC-50 R1 , dated April 15, 2005. Revise the Bulletin Record Page to show bulletin TBC-50 R1 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-50 R2 "In Effect" (IE).

This FCOM Bulletin will be canceled when an operator reports to Boeing that all airplanes in their fleet have SMYD part number 285A1010-7/-107 or newer. Refer to Service Letter 737-SL-27-193-A for additional information.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

IssueDate: July 25, 2008

Subject: Master Caution System Anomaly

Reason: This bulletin provides information about a Master Caution system anomaly during the Light Test.

The purpose of this reissue is to provide Service Letter information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

A Master Caution system anomaly has been found on 737-600/700/800/900 airplanes at Production Line Number 1640 thru Production Line Number 2168. These airplanes have provisions for GLS capability and have been equipped with a new Mode Control Unit (MCU).

When the Master LIGHTS switch is moved to the TEST position during the Light Test, all system lights and system annunciators will illuminate correctly. If the Master Caution “PUSH TO RESET” is pressed and released during the test, all system annunciators on the annunciator panel will extinguish, with the exception of the IRS annunciation, and the MASTER CAUTION light will re-illuminate. The MASTER CAUTION light and IRS light will extinguish when the Master LIGHTS switch is moved out of the TEST position.

This anomaly is present on Production Line Number 1640 thru Production Line Number 2168. To correct this anomaly, Boeing installed the P/N 69-37399-13 Mod A MCU starting at Production Line Number 2169.

Boeing Service Letter 737-SL-34-191 provides information on the upgrade that corrects this anomaly.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-52 R1 "In Effect" (IE).

This Flight Crew Operations Manual Bulletin will be cancelled after Boeing is notified that all affected airplanes in the operator's fleet have been modified by Boeing Service Letter 737-SL-34-191. If the operator does not plan to modify all the airplanes and would like to have the contents of this Bulletin incorporated in the Flight Crew Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-53 R2

IssueDate: April 26, 2023

Subject: Unwanted "GLIDESLOPE" Advisory During Approaches On Airplanes Equipped with the Integrated Approach Navigation (IAN) Option

Reason: This bulletin informs flight crews of the potential for receiving an unwanted or nuisance "GLIDESLOPE" advisory on IAN-equipped airplanes in certain unique conditions.

This bulletin is being revised to make editorial changes and to update the Administrative Information section.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Operators have reported occurrences of a nuisance GLIDESLOPE advisory at low height above the runway when an FMC-generated glidepath is present on approach. This advisory can occur anytime an approach other than ILS or GLS is selected in the FMC, the active waypoint is the runway/missed approach point and the airplane is below 1000 ft AGL. The approach (APP) mode does not need to be selected for this advisory to occur. Boeing has analyzed these events and has concluded these unwanted advisories typically occur when the barometric altimeter setting varies from the actual station pressure as the result of the use of an old altimeter setting, as a result of rapidly varying barometric pressure changes which lead to an outdated altimeter setting, or as a result of warmer than standard outside air temperature (OAT). A change in barometric pressure or warmer than standard OAT can cause the VNAV path to be slightly different than the Visual Glide Slope Indicator (VGSI), i.e., PAPI or VASI.

When these situations occur and the crew elects to modify the flight path below the FMC-generated path in order to follow the VGSI, the IAN glideslope protection feature can issue a GLIDESLOPE advisory even though the airplane may be on a safe and appropriate flight path in visual conditions. This is because the barometric VNAV path may not exactly coincide with the VGSI path.

The barometric VNAV path can be sensitive to changes in barometric pressure and/or temperature. A small difference in barometric pressure can alter the barometric VNAV path. For example, a .02 inches difference in pressure due to use of an old or incorrect altimeter setting can alter the FMC generated glide path by approximately 20 feet as the airplane approaches the runway.

Flight crews should be aware that differences in barometric pressure are a common occurrence and that air traffic facilities do not necessarily update the altimeter setting information when small changes in pressure occur, particularly when the weather is VFR. While most normal operations using good operating practice for altimeter settings will provide nuisance free operations regarding this type of GLIDESLOPE advisory, crews should be aware that such an advisory nonetheless can, in rare instances, occur.

This condition occurs only on airplanes equipped with the IAN option when an old or erroneous altimeter setting is used, a warmer than standard OAT exists at the airport, or in instances where the VGSI and the FMC generated glidepath are not coincident. These cases can lead to a VNAV path which does not correspond to the VGSI path.

Operating Instructions

- During an approach use the most current altimeter setting for the destination airport. Ensure the appropriate barometric pressure setting is set on each altimeter. At higher temperatures (approximately 25 degrees C and higher), the FMC-generated glide path may be noticeably higher than the guidance provided by the runway VGSI.
- At and below applicable minima with suitable visual references established, transition to use of the VGSI path for continuation of the approach to landing.
- In the event an IAN related GLIDESLOPE advisory occurs while in VMC at low altitude, after confirming the airplane is on a safe path, the crew may elect to do one or more of the following:
  - Silence the GLIDESLOPE advisory and continue on the VGSI path,
  - Re-establish the FMC based barometric VNAV path and transition to a visual approach and landing in the touchdown zone, or
  - Discontinue the approach.

Administrative Information

This bulletin replaces bulletin TBC-53 R1 , dated July 31, 2014. Revise the Flight Crew Operations Manual Bulletin Record Page to show bulletin TBC-53 R1 as “CANCELLED” (CANC).

737

Number: TBC-54 R1

IssueDate: April 11, 2006

Subject: FMC Update 549849-015 U10.6 Prediction Errors

Reason: This bulletin informs flight crews of a potential for erroneous ETA, RTA, fuel remaining and Mach number predictions.

The purpose of this reissue is to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Smiths Aerospace has discovered an error in the Update 549849-015 U10.6 FMC software. The software incorrectly processes wind data for certain downstream route legs which can result in erroneous values for ETA and fuel remaining for downstream waypoints. This anomaly also affects the ability of the FMC to control to a Required Time of Arrival (RTA) at a downstream waypoint. The error is a function of the entered/sensed wind, leg length, and course change between the incoming leg and outgoing leg for a downstream waypoint.

The 549849-015 U10.6 FMC predictions will be incorrect for leg segments that follow intermediate waypoints with a less than a two degree course change between the incoming and outgoing leg, for non-flyover points. The error will occur for leg segments with less than a ten degree course change for flyover points. This results in the FMC incorrectly applying winds for the particular leg. Depending on the magnitude and direction of the wind and the length and direction of the leg, the error in the ETA can range from nothing at all to more than 40 minutes. Fuel predictions and Mach targets will also be proportionally affected. This anomaly does not occur when there is a greater than two degree course change (ten-degree change for flyover waypoints) between the incoming and outgoing legs.

Flight crews should not use FMC downstream predictions for ETA, RTA, fuel remaining or Mach number target when operating with 549849-015 U10.6 FMC software. All predictions should be verified by conventional methods.

Boeing plans to revise, certify and deliver new 549849-016 U10.6 FMC software. Until that time, Boeing recommends all operators re-install U10.5A FMC software on those airplanes that delivered with 549849-015 U10.6.

Operating Instructions

When operating with 549849-015 U10.6 FMC software, do not use FMC predictions for ETA, RTA, fuel remaining or target Mach number. Verify all predictions by conventional methods.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-54 R1 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been modified by Boeing Service Bulletin 737-34-1768 which installs FMC software U10.6 part number 549849-016. If you do not plan to modify all your airplanes and would like to have the contents of this bulletin incorporated in your Operations Manual, please advise Boeing accordingly.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-59

IssueDate: April 1, 2006

Subject: Flight Deck Display Unit Blanking Anomaly

Reason: This bulletin informs flight crews of the potential for multiple flight deck display units blanking on PFD/ND airplanes with Navigation Performance Scales (NPS) enabled.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

An operator has reported events of both Inboard Display Units (DU's) and parts of the Center Upper and Center Lower DU's blanking during flight. During the DU blanking events multiple other indications/faults occurred, including MACH TRIM FAIL, SPEED TRIM FAIL, SPD LIM, EEC ALTN and the inability to engage the second autopilot during approach. DU blanking events have lasted from several minutes to a few hours in duration, with the DU's recovering automatically. When the DU's recovered, all other related indications/faults also cleared.

These events occur when the Right Outboard DU overheats. The overheat condition causes an invalid calculation in the Common Display System (CDS) software.

The root cause of the Right Outboard DU overheat is accumulation of dust in the DU vent holes, preventing effective draw-through cooling. Previous to the subject events, Boeing released Maintenance Tip 737 MT 31-005 that recommends operators check and clean the DU vents.

This anomaly is present on all PFD/ND airplanes with NPS enabled. A solution for this anomaly is planned to be incorporated in CDS Block Point 2006.

Operating Instructions

If multiple flight deck DU's blank, together with the associated indications/faults listed above, the Captain's EFIS Control Panel should be selected to VOR or APP mode. Since NPS is not active in the VOR or APP mode, this action will restore the DU's and clear the associated indications/faults.

If the Right Outboard DU cools sufficiently for the DU's to recover automatically, normal Navigation Display mode selection may be resumed.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-59 "In Effect" (IE).

This FCOM bulletin will remain in effect until CDS Block Point 2006 is delivered and Boeing is notified that all affected airplanes in your fleet have it installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company   **Seattle, Washington 98124-2207**   737

Number: TBC-61

IssueDate: August 4, 2006

Subject: Head-Up Display (HUD) Software Anomaly

Reason: This bulletin informs flight crews of a discrepancy between the airspeed indications on the HUD and on the EFIS or PFD for 737-800/900 airplanes.

> Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

In Common Display System (CDS) Block Points 2004 and on, the VREF+15 (white) bug on the EFIS Mach/Airspeed Indicator and on the PFD speed tape is changed to a VREF+20 (white) bug for 737-800/900 airplanes. This change provides the appropriate tail clearance margin during a one engine inoperative flaps 15 landing.

The Head-Up Display (HUD) has a VREF+15 (PRI in flight mode) bug for all 737-600/700/800/900 airplanes.

A fix for 737-800/900 airplanes is being considered for a future update of the HUD software.

Operating Instructions

On 737-800/900 airplanes with CDS Block Points 2004 and later, do not use the HUD indication of VREF+15 for a one engine inoperative flaps 15 landing. Use the EFIS Mach/Airspeed Indicator or PFD speed tape indication of VREF+20.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-61 "In Effect" (IE).

This FCOM bulletin will remain in effect until the new HUD software has been delivered and Boeing is notified that all affected airplanes in your fleet have it installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company **Seattle, Washington 98124-2207**	737

Number: TBC-62

IssueDate: October 16, 2006

Subject: FMC Update U10.6 Erroneous Holding Pattern

Reason: This bulletin informs flight crews of the potential for an erroneous holding pattern.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Several operators have reported events of unusually large holding patterns being shown on the FMC MAP display. In each case, the holding pattern was initially shown correctly but when either the DECEL was sequenced prior to the hold or the airplane was established in the hold, the holding pattern became larger than expected. When LNAV was engaged, the autopilot or flight director commanded very shallow bank angles during the turns. In addition, the scratchpad message "UNABLE HOLD AIRSPACE" was shown prior to entering the holding pattern. In all events, the flight crew had made a manual airspeed, not Mach speed, entry on the RTE HOLD page.

Boeing and Smiths Aerospace have confirmed that the anomaly was introduced in the U10.6 FMC software update and affects U10.6 only. This anomaly occurs when a manual airspeed entry is made on the RTE HOLD page and, in all cases, the anomaly results in display of the FMC alerting message "UNABLE HOLD AIRSPACE".

The unusually large holding pattern can be returned to normal by deleting the airspeed entry from the SPD/TGT ALT line on the RTE HOLD page.

Operating Instructions

Do not enter an airspeed on the RTE HOLD page.

If an airspeed is entered on the RTE HOLD page and an unusually large holding pattern is shown on the FMC MAP display, delete the airspeed entry from the SPD/TGT ALT line on the RTE HOLD page. After the airspeed entry is deleted, the holding pattern will be sized correctly.

If a holding airspeed change is required, use the SPD INTV switch (if installed), or discontinue VNAV flight and use the IAS/MACH selector on the MCP.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-62 "In Effect" (IE).

This anomaly has been corrected in the U10.7 FMC software update. This FCOM bulletin will remain in effect until the new U10.7 FMC software has been delivered and Boeing is informed that all affected airplanes in your fleet have it installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-63

IssueDate: November 13, 2006

Subject: NO LAND 3 Annunciation After Landing

Reason: This bulletin informs flight crews of the potential for an erroneous NO LAND 3 message after landing following an autopilot disconnect inflight.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

A discrepancy has been discovered on airplanes equipped with Fail Operational capability which may result in display of the NO LAND 3 message after landing.

A timing issue exists between the MCP autopilot disengage warning light output and the monitor of this output in the FCC. When the autopilot is disengaged, the MCP output toggles on and off to flash the warning light. On airplanes equipped with Fail Operational capability, the FCC monitors this output and if the warning is not detected, the FCC will fault the MCP and set the warning itself. If the initial warning pulse from the MCP is too short for the FCC to detect, the MCP is faulted erroneously and a NO LAND 3 latched fault is set. No flight deck effect or system downgrade will occur in flight. However, after landing, NO LAND 3 will annunciate on the Upper Display Unit when wheel speed decreases below 60 knots.

This anomaly will be corrected in the next Collins FCC software update, currently scheduled for release in the first quarter of 2007.

Operating Instructions

If NO LAND 3 annunciates after landing, the event should be entered into the aircraft log. If the fault is not reset by Maintenance, subsequent approaches are limited to LAND 2.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-63 "In Effect" (IE).

This FCOM bulletin will remain in effect until the new FCC software has been delivered and Boeing is informed that it has been installed on all affected airplanes.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Subject: FMC Failure

Reason: This bulletin informs flight crews of the potential for failure of the FMC with Update U10.5, U10.5a or U10.6 software installed.

The purpose of this revision is to provide new operating instructions.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Operators have reported events in which the FMC has momentarily failed and then returned with an inactive route. When the route was again activated, the FMC failed a second time.

Analysis of the events has revealed an anomaly in the Smiths Aerospace FMC U10.5, U10.5a and U10.6 software which can prevent correct implementation of flight plan legs longer than approximately 1000 NM. When a leg over 1000 NM becomes the active leg for any reason (planned or modified route), an incorrect FMC speed prediction can cause the FMC(s) to fail. FMC function will return but the route will be inactive and a discontinuity will be inserted on the CDU before the previously entered route. If the same route is once again selected, the FMC(s) may fail a second time. FMC function will return a second time; however, all of the route information will be lost. If the leg is entered into the FMC again within two minutes of the original failure, the FMC(s) may fail a third time. A third FMC failure causes a latched failure and the FMC(s) will not be available for the remainder of the flight. This failure can occur with either single or dual FMC installation. With the dual FMC installation, both FMCs will fail.

Further investigation has revealed the potential for this anomaly is extremely rare.

Flight conditions must be such that the predicted speed is limited by current conditions (e.g., thrust limited) to a value less than the target speed. Because the target speed is not reached, the prediction routine exceeds its maximum number of iterations and a FMC restart occurs. If the speeds are not near a limiting boundary, the failure will not occur. It is therefore possible to fly the same flight plan many times with no failure, and then experience a failure on a different flight. If the criteria for the anomaly exist, the failure will occur when the route is modified whether or not the modification is executed.

The anomaly exists in Smiths FMC Update U10.5, U10.5a and U10.6 software. It has been corrected in FMC Update U10.7 software which is scheduled to be available via Service Bulletin in the first quarter of 2007.

Operating Instructions

If a re-route is desired and the route modification results in a leg greater than 1000 NM:

1. Prior to entry into the CDU, modify the route to ensure no leg exceeds 1000 NM. Confirm and execute the desired route.
2. If the FMC(s) fails after the route is modified and then returns with an inactive route, do not recreate the route that caused the failure. Advise ATC that you are unable to accept the re-routing and request clearance to an intermediate waypoint that results in a leg length less than 1000 NM.
3. In the event of a latched failure, accomplish the FMC FAIL Non-Normal Checklist.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-64 R1 "In Effect" (IE).

This FCOM bulletin will be remain in effect until FMC Update U10.7 software has been delivered and Boeing is informed that it has been installed on all affected airplanes.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-65

IssueDate: February 12, 2007

Subject: Incorrect Implementation of TO/GA to LNAV Feature with CDS Blockpoint 06 (BP06) and FMC Update U10.5 or U10.5A Installed.

Reason: This bulletin informs flight crews of incorrect implementation of the optional TO/GA to LNAV feature when CDS BP06 is installed in conjunction with FMC Update U10.5 or U10.5A.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During production flight test of an airplane with FMC Update U10.5A and CDS Blockpoint 06 (BP06) installed, flight crews noticed the optional TO/GA to LNAV mode (Go-Around Roll Mode – LNAV) was unexpectedly armed after flaps were extended. Further investigation revealed CDS BP06 software can inadvertently enable the TO/GA to LNAV mode when installed in conjunction with FMC Update U10.5 or U10.5A software. If CDS BP06 is installed with FMC Update U10.6, the TO/GA to LNAV mode is correctly implemented and is only available if the option has been purchased by an operator. If CDS BP06 is installed with FMC Update U10.5 or U10.5A, however, the TO/GA to LNAV mode is armed whenever the leading edge devices are extended to the commanded position, an FMC approach has been selected and the logic for LNAV arm is satisfied.

Boeing did not intend the TOGA to LNAV feature to be enabled with FMC Update U10.5 or U10.5A, and this software combination has never been certified by the FAA. Because the function may be confusing to the flight crew when it is inadvertently enabled, Boeing recommends operators ensure CDS BP06 is not installed with FMC Update U10.5 or U10.5A. Operators should install FMC Update U10.6 with CDS BP06 or install an earlier CDS BP with FMC Update U10.5A and earlier. Operators should be aware, however, that FMC Update U10.6 is required for correct implementation of all short field performance features.

Operating Instructions

If CDS BP06 is installed with FMC Update U10.5 or U10.5A:

1. On the ground, if LNAV arm is displayed in white on the FMA without selection of LNAV prior to TOGA, there is no operational effect. The indication is a nuisance display only and will extinguish when TO/GA is pressed. No crew action is required.
2. On the ground, if LNAV is selected prior to TO/GA, all FMA indications and LNAV operation are correct. No additional crew action is required.
3. During approach:

Collins FCCs installed

If LNAV arm is displayed in white on the FMA, the go-around roll mode will automatically transition from track hold to LNAV above 50 feet RA during a flight director missed approach. During an autopilot go-around, LNAV will engage when the airplane is above 400 feet AGL. Below these transition altitudes, the roll mode will be TO/GA (flight director or autopilot commands track hold).

Honeywell -709 FCCs installed

If LNAV arm is displayed in white on the FMA, the go-around roll mode will automatically transition from track hold to LNAV above 400 feet RA during a flight director or autopilot go-around. Below this transition altitude, the roll mode will be TO/GA (flight director or autopilot commands track hold).

With either FCC software installed, the flight crew must be aware the flight director will provide roll guidance to the LNAV path. If an alternate missed approach has been assigned, the PF must maintain the correct course manually. A different roll mode can be selected above 400 feet AGL.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-65 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have the correct FMC and CDS BP software combinations installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company **Seattle, Washington 98124-2207**	**737**

Number: TBC-66

IssueDate: March 16, 2007

Subject: Instrument Procedure, Transition Altitude and FMC Loss of Flight Information (FMC Update U10.6)

Reason: This bulletin informs flight crews of the potential for FMC software restarts on airplanes with FMC Update U10.6 installed.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Operators of B737 airplanes with FMC Update U10.6 installed have reported events in which instrument departure procedures (SIDs or DPs) have triggered FMC software restarts when using altimeter settings above standard. This FMC restart anomaly has, in rare instances, occurred both on the ground and inflight at a very limited number of airports which have instrument procedures in which an FMC path prediction step terminates at an altitude that is within a specified altitude block below the transition altitude.

Further investigation has determined the anomaly is related to FMC vertical predictions being affected by a combination of barometric setting, transition altitude and other altitudes used by the FMC prediction routine. The anomaly does not exist at altitudes above the transition altitude or during cruise and descent.

FMC predictions are done in steps that are calculated based on altitude, speed, or distance. Each step predicts flight parameters up to a waypoint, a deceleration, a restriction altitude, or something similar. Some of these terminations are visible points in a flight plan and some are not. Some represent entered data; some do not. Each new step starts where the previous one ended.

If the local barometric setting is greater than 29.92 inches Hg (1013 mB) and any prediction step terminates at an altitude that is within a specified altitude block below the transition altitude, the anomaly may occur. The FMC will be unable to complete its prediction and will force a restart. During the restart, all FMC functionality, including vertical and lateral guidance, will be lost. If the flight crew continuously attempts to re-enter FMC data while below transition altitude, a total FMS failure may occur and the FMC will not be available for the remainder of the flight. Once the airplane has climbed above the transition altitude, “FMC” can be selected on the MENU page, FMC data can be re-entered and executed, and the FMC will operate normally.

This anomaly is corrected in FMC Update U10.7 and does not exist in Update U10.5/U10.5A. The software retrofit, Boeing Service Bulletin 737-34-1918, is scheduled for release in early second quarter 2007.

Operating Instructions

The anomaly will not occur if the local barometric setting is equal to or less than 29.92 inches Hg (1013 mB). No crew action is required.

If the local barometric setting is greater than 29.92 inches Hg (1013 mB), Boeing recommends operators consider one or more of the following:

1. If an instrument departure procedure (SID or DP) has been identified as one in which this type of FMC restart has occurred or is believed to have occurred, do not use the instrument procedure. Use an alternate SID or DP, or plan to use non-FMS dependent navigation methods until climbing above the transition level. If the procedure can be flown using ground based navigation aids by conventional means, do so. Do not enter the departure into the FMC. Fly the procedure using conventional navigation methods.
2. If an affected departure procedure must be flown and the method described above is not possible, a workaround may be used. If the local barometric setting is greater than 29.92 inches Hg (1013 mB), overwrite the transition altitude (TRANS ALT) on the PERF INIT page with an altitude 1000 feet above the cruise altitude. If the cruise altitude is subsequently raised, the transition altitude in the FMC must also be raised. Flight crews must be aware that all altitudes on the FMC LEGS pages will now be displayed in thousands of feet rather than Flight Levels.

   The standard barometric setting must be selected on the altimeters as usual when passing through the actual transition altitude. On those airplanes with the PFD/ND display, the barometric indication will not turn boxed amber to indicate the local barometric setting is still set and the airplane is climbing above the actual transition altitude.

The correct transition altitude can be entered on the PERF INIT page at any time after climbing through the actual transition altitude. The correct value for the descent transition level can be entered on the DES FORECASTS page at any time, including during preflight.

3. If a departure procedure not previously identified as susceptible to FMC restarts is flown and an FMC restart occurs during the climb, do not attempt to re-enter FMC data until the airplane has climbed above the transition altitude. Resume conventional navigation using ground based navigation aids. If a total FMC failure occurs and the FMC is no longer available (e.g., no “FMC” prompt on the MENU page), accomplish the FMC FAIL Non-Normal Checklist.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-66 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have FMC Update U10.7 installed.

BOEING

Flight Crew Operations Manual Bulletin for The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-67

IssueDate: March 5, 2007

Subject: Spoiler Retraction Failure on Airplanes with the Short Field Performance Package

Reason: This bulletin informs flight crews of the potential for the flight spoilers to fail to retract fully on airplanes equipped with the Short Field Performance package.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

An operator of a B737 airplane equipped with the Short Field Performance package has informed Boeing of failures of flight spoilers to retract after the speedbrake handle was moved to the DOWN position after landing. The spoiler was discovered in the full extended position during a routine maintenance walk-around. The spoiler remained in the full extended position after cycling of the speedbrake handle.

Further investigation has determined the failure can occur during a rejected takeoff maneuver, during a rejected landing or during a full stop landing, following deployment of the speedbrakes, either automatically or manually.

If the failure is not detected prior to takeoff, the takeoff configuration warning will not sound if any flight spoiler remains extended with the speedbrake handle in the DOWN position.

The cause of the failure has been identified as interference within the actuator main control valve. Boeing and the actuator supplier are actively working to modify the system and to provide new actuators to the fleet. Service Bulletin information will be provided as soon as it is available.

Operating Instructions

The following operating instructions are intended to prevent a takeoff with one or more spoiler panels extended:

1. A visual inspection of spoiler position must be conducted after landing prior to turning the electric motor driven hydraulic pumps off. This inspection can be conducted by qualified ground personnel or flight crew.

   After landing, ensure the speedbrake handle is in the DOWN position. Prior to engine shutdown, configure the airplane to maintain electric power via APU or ground source. Do not shut down the electric motor driven hydraulic pumps. After engine shutdown, with hydraulic power on, visually verify all spoilers are properly stowed. If any spoilers remain in the UP position with the speedbrake handle in the DOWN position, contact maintenance.
2. Conduct a visual inspection as discussed above following any rejected takeoff maneuver in which spoilers have been deployed to verify all spoilers are properly stowed.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-67 "In Effect" (IE).

This condition is temporary until the cause of the anomaly is identified and the system is modified. This FCOM bulletin will be revised to include Service Bulletin information when available.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company **Seattle, Washington 98124-2207**	737

Number: TBC-68

IssueDate: April 16, 2007

Subject: Unintentional Initiation of the FMC Engine Out Mode (FMC Update U10.7)

Reason: This bulletin informs flight crews of the potential for the FMC to unintentionally enter the ENG OUT mode on airplanes with FMC Update U10.7 installed.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During production flight test of an airplane with FMC Update U10.7 installed, the flight crew inadvertently set a condition in which the FMC transitioned into the “ENG OUT” mode while on the ground. The event occurred when one thrust lever was advanced to stow the speedbrakes, to verify the autostow function, while the ground speed was greater than 30 knots.

The difference in thrust lever position is sensed by the FMC and when the difference exceeds 52 degrees, the FMC will transition into the ENG OUT mode if ground speed is greater than 30 knots. Subsequently, the ALL ENG prompt will be displayed in LSK 4L on the CLB page.

Further investigation has determined that the FMC will not transition back into the ALL ENG mode until one of the following occurs:

1. The flight crew selects the ALL ENG prompt in LSK 4L on the CLB page and the page is executed,
2. The airplane becomes airborne and the FMC transitions into CRZ mode, or
3. The FMC is powered down completely and re-powered on the ground.

As a result, if the ENG OUT mode is set during taxi and the crew neglects to select and execute ALL ENG on the CLB page or remove power from the FMC, VNAV will remain in the ENG OUT mode during climb and provide climb target speeds that are lower than normally expected in the ALL ENG mode.

This anomaly exists only in FMC Update U10.7. A correction to the software is planned for U10.8.

Operating Instructions

To prevent inadvertent transition into the “ENG OUT” mode while on the ground:

1. Do not stow the speedbrake lever following a normal landing or a rejected takeoff by advancing one thrust lever. Manually stow the speedbrake lever.
2. Avoid taxi speeds above 30 knots when accomplishing a single engine taxi.
3. Do not split the thrust levers when operating at taxi speeds at or above 30 knots.

If an inadvertent transition into the “ENG OUT” mode has occurred:

1. On the ground or inflight, select the ALL ENG prompt in LSK 4L on the CLB page and execute, or
2. On the ground, remove all power from the FMC prior to the next takeoff.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-68 "In Effect" (IE).

This bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have FMC Update U10.8 installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-70

IssueDate: June 11, 2007

Subject: Arming VNAV on the Ground (FMC Update U10.7)

Reason: This bulletin informs flight crews of the inconsistencies associated with arming VNAV on the ground and provides flight crew instructions to not arm VNAV prior to takeoff.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports of inconsistencies associated with the arming of VNAV prior to takeoff on 737NG airplanes equipped with FMC Update U10.7. These inconsistencies can occur even on those airplanes with the configuration specified in Service Bulletin 737-34-1918 installed, i.e., FMC Update U10.7, CDS Blockpoint 06 and Collins Autopilot P4.0.

Additionally, VNAV may incorrectly engage rather than arm if an FCC version earlier than Collins FCC P4.0 or Honeywell -710 is installed. For FCC P4.0 or Honeywell -710 or later installations, VNAV may engage rather than arm under certain conditions when the departure is not aligned within 5 degrees of the runway. With VNAV engaged on the ground, when TOGA is pressed VNAV will disengage and the MCP IAS/MACH display will open and display 120 knots (Collins FCC) or 100 knots (Honeywell FCC).

This anomaly exists only with FMC Update U10.7. It will be corrected in a future software upgrade of the FMC and/or FCC.

Operating Instructions

1. Do not attempt to arm VNAV on the ground prior to takeoff.

2. In the event the VNAV button is pressed inadvertently on the ground, turn both flight director (F/D) switches OFF. Turn the F/D switch ON for the pilot flying first and then turn the F/D switch ON for the pilot monitoring. Verify the correct V2 speed is entered in the MCP IAS/MACH display.
3. Once airborne, VNAV can be selected after flaps and slats retraction is complete.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-70 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have the correct FMC and FCC software upgrade installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company **Seattle, Washington 98124-2207**	737

Number: TBC-71 R3

IssueDate: November 16, 2007

Subject: APU Electrical Bus Disconnect

Reason: This bulletin informs flight crews of the potential for the APU to drop off the bus if powering an AC transfer bus in flight and descending from altitudes above FL260. This revision provides corrective action, corrects MMEL information and provides additional information about which airplanes are no longer affected by this bulletin.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During production flight test, Boeing flight crews have recently experienced an increase in the number of instances in which the APU is automatically disconnected from the bus when powering an AC transfer bus in flight during descent from altitudes above FL260. Engineering analysis has determined this fault is due to a change in the APU fuel system that was introduced in production at airplane Line Number 2299 and on. The first airplane with the new APU fuel system is scheduled for delivery 25 June 2007.

The change was made to address an APU fuel system problem that resulted in fuel leaks into the APU compartment due to pressure buildup between the fuel flow manifold solenoid shutoff valve and a check valve in the secondary APU fuel manifold. To address this issue, the positions of the shutoff valve and the check valve were reversed.

When the APU is operating above FL250, the APU fuel system automatically shuts off fuel to the secondary manifold. The system transitions back to the secondary manifold when the airplane descends through approximately FL260.

With the recent fuel system change, when this switching occurs, fuel flow to the secondary manifold results in a momentary decrease in fuel flow to the primary manifold. The APU fuel control logic does not maintain an adequate fuel pressure in the combined fuel manifold, resulting in the APU speed momentarily dropping below the AC transfer bus cutoff frequency. The APU generator is automatically disconnected from the bus and the Master Caution, ELEC system annunciator and amber SOURCE OFF lights illuminate.

In response to the speed drop, the APU control system increases fuel flow and the APU system will again be available to supply electrical power to an AC transfer bus within 4 seconds. The blue APU GEN OFF BUS light will illuminate to indicate the APU is available. The APU generator can be selected ON and the APU will remain connected to the bus for the remainder of the flight. It should be noted that while the APU speed is below the AC bus cutoff frequency, the blue APU GEN OFF BUS light is extinguished, indicating the APU is not available to power a bus.

Honeywell originally proposed an APU Engine Control Unit (ECU) software change. That decision was reconsidered and Honeywell has released Service Bulletin 131-49-7949, Rev. 1, to provide information to change the revised plumbing back to the original configuration. 737NG Production Line Number 2297 and the majority of Production Line Numbers 2299 through 2396, with APU Serial Numbers P-7535 through P-7637, have been converted by incorporating the referenced Honeywell Service Bulletin. Honeywell is working with operators of the remaining in-service airplanes to ensure all affected APUs are converted. This bulletin does not apply to airplanes with Honeywell Service Bulletin 131-49-7949, Rev. 1 incorporated.

All 737NG Production Line Numbers 2397 and on were delivered with APUs built with the original fuel flow divider (APU Serial Numbers P-7638 and on.) This bulletin does not apply to these airplanes. The MMEL has been revised to restrict single main engine IDG dispatch (MMEL item 24-1) for the affected airplanes to flight altitudes at or below FL220.

The MMEL revision will only permit airplanes with APU serial number P-7534 and lower, or those with Honeywell Service Bulletin 131-49-7949 or the production equivalent (APU Serial Number P-7638 and higher) incorporated, to have 3-day MMEL dispatch relief per MMEL 24-1 that is unrestricted by altitude.

Operating Instructions

If the APU is operating and connected to an AC bus in flight and the Master Caution, ELEC system annunciator and amber SOURCE OFF lights illuminate during descent, select the APU generator switch ON when the blue APU GEN OFF BUS light illuminates. It will require approximately 4 seconds for the APU generator to be available following an automatic disconnect.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-71 R3 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have had Honeywell Service Bulletin 131-49-7949, Rev. 1 incorporated to change the revised APU plumbing back to the original fuel flow divider configuration.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-73

IssueDate: January 28, 2008

Subject: FMC Lockup with Selection of a Standard Instrument Departure (SID) on Missed Approach (FMC Update U10.0 and later)

Reason: This bulletin informs flight crews of the potential for the FMC to lockup following selection of a SID during a missed approach procedure.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During simulator testing, a Boeing flight crew experienced an FMC lockup and subsequent reset following selection of an engine out (EO) standard instrument departure (SID) procedure while flying an LNAV missed approach. The FMC reset shortly after the lockup and all entered data was retained. The crew was able to select the desired active waypoint and re-capture the LNAV route by using the INTC ARC function.

Further discussions with GE Aerospace have determined the problem can occur when the leg after the active waypoint in the flight plan for the missed approach is an arc leg, and a SID (normal or EO) is selected to create a modified flight plan.

This anomaly exists in FMC Update U10.0 and later. The anomaly will be corrected in FMC Update U10.8.

Boeing recommends operators evaluate this information to determine if it is applicable to their flight operations. A decision can then be made as to whether it is necessary to release this bulletin to Flight Crew.

Operating Instructions

Do not select a SID (normal SID or EO SID) while flying an LNAV missed approach procedure.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-73 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have FMC Update U10.8 installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin

The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-74

IssueDate: September 22, 2008

Subject: Hand Microphone Use With Flight Deck PC Power Outlets

Reason: To inform flight crews of a new restriction on using the flight deck PC power outlets when the hand microphone is used.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received customer complaints of interference when using hand held microphones both on the ground and in flight. Investigation has shown interference may be caused by items plugged into the PC power outlets on the flight deck. Any item plugged into a PC power outlet, whether turned on or not, can cause interference. AC 91-21.1B prohibits the use of items that cause interference with communications.

Boeing is issuing placards that state: “WHEN USING HAND MIC REMOVE PWR CORD FROM OUTLET.”

Operating Instructions

Remove any power cord from the flight deck PC power outlet before using the hand microphone

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-74 "In Effect" (IE).

This condition is temporary until the system is modified. This FCOM bulletin will be revised to include Service Bulletin information when available.

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been modified by Service Bulletin.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company

737

Number: TBC-75 R1

IssueDate: April 30, 2009

Subject: Cabin Altitude Warning Indications and Procedures Briefing

Reason: This revision is to inform flight crews that the FAA has agreed to an Alternative Method of Compliance (AMOC) to the takeoff briefing mandated by AD 2008-23-07. The requirement to don oxygen masks only applies when the intermittent warning horn sounds and the airplane flight altitude is above 10,000 feet MSL.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

The B737 cabin altitude warning system consists of an intermittent warning horn that sounds when cabin altitude exceeds 10,000 feet. Both the cabin altitude warning and takeoff configuration warning use the same intermittent horn.

Following a fatal accident in August 2005, the FAA initiated planned Airworthiness Directive (AD) action to provide additional cabin altitude warning information for B737 flight crews.

To support this planned AD, Boeing has designed a change to the warning system to provide separate “CABIN ALTITUDE” and “TAKEOFF CONFIG” warning lights to accompany the existing dual-purpose intermittent warning horn. This design change is now available on production airplanes. Service bulletin information to support the planned AD will become available in mid-2009.

To help mitigate any possible confusion associated with the B737 cabin altitude warning system, the FAA issued AD 2006-13-13 which required changes to the AFM procedures in Section 2 for responding to the intermittent cabin altitude/ configuration warning horn. These AFM changes and associated Flight Crew Operations Manual (FCOM) Quick Reference Handbook (QRH) non-normal checklist changes were intended to make it easier for flight crews to determine whether the intermittent horn was sounding for cabin altitude or for takeoff configuration.

The FAA believed, however, that additional interim action was necessary until such time as the new warning lights could be fully implemented in the B737 fleet.

In mid-2008, the FAA determined that the most practical interim solution was to issue AD 2008-23-07. This AD requires flight crews to brief cabin altitude warning indications and procedures as part of the takeoff briefing before engine start on the first flight of the day or following a flight crew member change. This briefing is required in any B737 in which the CABIN ALTITUDE and TAKEOFF CONFIG lights are not installed, or are installed but not activated.

Following further discussions, the FAA has agreed that a need exists for crews to recognize the difference between an intermittent warning horn sounding in flight below 10,000 feet MSL, as opposed to sounding at or above 10,000 feet MSL. In flight below 10,000 feet MSL, the intermittent warning horn is associated with an inflight failure of the Air-Ground Sensor switch. At or above 10,000 feet MSL, sounding of the intermittent warning horn requires the crew to immediately don oxygen masks and set regulators to 100%.

The FAA has therefore approved an Alternative Method of Compliance (AMOC) to the Non-Normal Procedures mandated by AD 2006-13-13 and to the Takeoff Briefing mandated by AD 2008-23-07. The AMOC was approved by FAA Approval Letter 130S-09-134a dated April 28, 2009.

AD 2006-13-13

The current WARNING HORN – CABIN ALTITUDE OR CONFIGURATION Non-Normal Procedure in the AFM will be revised as follows:

1. The title will be changed to WARNING HORN OR WARNING LIGHT – CABIN ALTITUDE OR TAKEOFF CONFIGURATION.

2. The condition statement and the procedure will include reference to the CABIN ALTITUDE and TAKEOFF CONFIG lights.

3. The requirement to don oxygen masks, establish crew communications and do the CABIN ALTITUDE or Rapid Depressurization checklist will only apply if the intermittent warning horn sounds or a CABIN ALTITUDE light illuminates in flight at an airplane flight altitude above 10,000 feet MSL.

4. Reference to the steady horn in the condition statement will be deleted. The corresponding step in the procedure will be deleted.

A new AFM Non-Normal Procedure, LANDING CONFIGURATION, will be created to direct crews to assure correct landing configuration if the steady horn sounds in flight.

The current WARNING HORN – CABIN ALTITUDE OR CONFIGURATION QRH non-normal checklist will be revised in a future revision of the FCOM QRH to include the changes defined in the AMOC. In addition, a new checklist, titled LANDING CONFIGURATION will be added. The QRH checklists may not be an exact replica of the AFM procedures, but will be written for consistency with the Boeing format.

AD 2008-23-07

The Cabin Altitude Warning Takeoff Briefing in Section 3 of the AFM will be revised to clarify that immediate donning of oxygen masks and accomplishment of the subsequent memory item steps from the WARNING HORN OR WARNING LIGHT – CABIN ALTITUDE OR TAKEOFF CONFIGURATION non-normal checklist are only required if the intermittent warning horn sounds in flight at an aircraft flight altitude above 10,000 feet MSL.

The Takeoff briefing in the Before Start Procedure in the Normal Procedures section of the FCOM will be updated in a future revision to reflect this change.

Operating Instructions

To further reduce the risk of flight crew incapacitation due to hypoxia following loss of cabin pressurization, cabin altitude warning indications and memory item procedures must be briefed on airplanes in which the CABIN ALTITUDE and TAKEOFF CONFIG lights are not installed, or are installed but not activated. This briefing will be included as an additional item on the Takeoff briefing before engine start for the first flight of the day or following any change of either flight crew member.

The briefing must include the following:

- Whenever the intermittent warning horn sounds in flight at an airplane flight altitude above 10,000 feet MSL:

1. Immediately, don oxygen masks and set regulators to 100%.
2. Establish crew communications.
3. Do the CABIN ALTITUDE WARNING or Rapid Depressurization non-normal checklist.

- Both pilots must verify on the overhead Cabin Altitude Panel that the cabin altitude is stabilized at or below 10,000 feet before removing oxygen masks.

Operators may want to seek an Alternative Method of Compliance (AMOC) to develop a new crew briefing or to utilize current approved briefings to meet the compliance of this AD.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-75 R1 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have the CABIN ALTITUDE and TAKEOFF CONFIG lights installed and activated.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-76

IssueDate: April 13, 2009

Subject: Instrument Approach Procedures with an FMC Missed Approach Altitude Constraint Above 10,000 feet MSL

Reason: This bulletin informs flight crews of an anomaly associated with approaches having a missed approach with an altitude constraint above 10,000 feet MSL in the FMC.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During simulator testing, an anomaly was identified when attempting to fly an instrument approach using VNAV for an RNAV (RNP) procedure having a missed approach point with an altitude constraint above 10,000 feet MSL.

The FMC builds the descent path upward and back in the direction of the Final Approach Fix (FAF) by starting at the location of the missed approach waypoint (MAP) and its associated altitude constraint. The FMC calculates this path using the coded Glide Path (GP) angle, also called the vertical angle. The MAP is normally shown on the LEGS page as an RWxx or MXxx waypoint. When the MAP is the runway threshold, the altitude constraint is typically the threshold elevation plus threshold crossing height.

For a missed approach point with an altitude constraint above 10,000 feet MSL, the FMC does not consider the altitude constraint to be valid. The FMC uses the airport elevation rather than the MAP altitude as the starting altitude for path construction. The difference between the missed approach point altitude constraint and the airport elevation results in an incorrect VNAV path.

This anomaly exists in FMC Updates U7.1 and later. The anomaly will be corrected in FMC Update U11, currently scheduled for release in the 4th quarter of 2010.

Boeing recommends operators evaluate this information to determine if it is applicable to their flight operations by reviewing their approach procedures to airports with an elevation above 9000 feet. A decision can then be made as to whether it is necessary to release this bulletin to Flight Crew.

Operating Instructions

1. On an approach procedure that has a missed approach point with an altitude constraint above 10,000 feet MSL, do not use VNAV after the Final Approach Fix (FAF). LNAV or other appropriate roll modes may be used through the approach procedure.
2. Do not use the VNAV path deviation indication on the MAP display or the Vertical Deviation (VERT DEV) information on the FMC Descent page for descent rate guidance after passing the FAF.
3. Ensure compliance with each minimum altitude constraint on the final approach segment (step-down fixes).

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-76 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have FMC Update U11 installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-77

IssueDate: April 27, 2009

Subject: Nuisance Predictive Windshear (PWS) Fail Annunciations with the Honeywell RDR-4000 Weather Radar

Reason: This bulletin informs flight crews of a nuisance PWS FAIL annunciation on airplanes with the Honeywell RDR-4000 weather radar system installed.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing Flight Test has experienced PWS FAIL annunciations after landing due to qualifier faults on takeoff, missed approach and go-around on B737 airplanes with the Honeywell RDR-4000 weather radar (WXR) system installed.

In order to ensure the WXR is actively scanning for windshear events ahead of the airplane during takeoff and landing, Boeing and Honeywell have incorporated qualifiers to automatically activate the WXR in the event the pilots do not have it selected on at least one Navigation Display. If a qualifier check fails during takeoff, missed approach or go-around, the PWS will continue to function correctly for the current flight. The PWS FAIL annunciation will display when the airplane is below 25 feet AGL and the airspeed is below 60 KCAS.

Honeywell is scheduled to release a software modification in the 3rd quarter of 2009 to address these faults.

Operating Instructions

If PWS FAIL is annunciated after landing, when the airplane decelerates below 60 KCAS, inform maintenance personnel of the annunciation upon completion of the flight.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-77 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have the Honeywell software Mod 5 installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-79

IssueDate: June 26, 2009

Subject: VNAV Not to Be Used for Approach Operations with FMC Update U10.8 Installed

Reason: This bulletin informs flight crews that VNAV approaches are no longer authorized with FMC Update U10.8 software installed.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

An operator with FMC Update U10.8 installed has reported incidents in which an inappropriate STEEP DESCENT AFTER XXXXX message is displayed, where XXXXX is the name of a waypoint in the flight plan. Upon reaching the specified waypoint, the autoflight system commands the airplane to descend below the expected path on approach. GE has been able to reproduce the anomaly and has identified that the issue is due to incorrect prediction logic.

The VNAV descent path is predicted backwards, starting at the destination and ending at cruise altitude. GE has determined that an error in FMC Update U10.8 results in the VNAV path being built to the wrong waypoint, specifically to a waypoint with an AT constraint upstream of the waypoint where the steep descent takes place.

This can occur during descent or approach where a waypoint with an AT OR ABOVE constraint is between two waypoints with AT constraints. It is possible that an error in the prediction logic will calculate an incorrect path between the AT waypoints that is lower than the published navigation database (NDB) path. Under these conditions, the published NDB path is not honored, and after sequencing the waypoint with the AT OR ABOVE constraint, the aircraft may attempt to dive to capture the incorrect predicted path.

During analysis, it was determined that the STEEP DESCENT message may not always be displayed when this anomaly occurs. The STEEP DESCENT message only indicates that the vertical path discrepancy is 200 feet or more. A discrepancy of less than 200 feet will not be annunciated by the STEEP DESCENT message.

This anomaly exists only in FMC Update U10.8; VNAV approaches can still be flown with FMC Update U10.7 and earlier. A correction to the software is planned for U10.8A.

Operating Instructions

With FMC Update U10.8 installed, do not fly any instrument approach using VNAV.

Use a conventional approach, if available. If an RNAV approach without GP or VNAV guidance is absolutely required, consider flying the approach using V/S by selecting the approach procedure from the arrivals page of the FMC. Do not use the VNAV path deviation indication on the map display for descent rate guidance. Ensure compliance with all minimum altitude constraints on the approach (step-down fixes).

LNAV is still available. IAN and VSD are not affected by this anomaly.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-79 "In Effect" (IE).

This FCOM bulletin will remain in effect until Boeing is informed that all affected airplanes in your fleet have FMC Update U10.7 and earlier, or U10.8A installed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-80

IssueDate: July 17, 2009

Subject: Reversion from FMC Update U10.8 to Update U10.7 or earlier

Reason: This bulletin informs flight crews of information in the Flight Crew Operations Manual and QRH that will no longer be applicable following removal of FMC Update U10.8.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

In accordance with Service Bulletin SB 737-34A2207 dated 29 June 2009, Boeing Multi-Operator Message (MOM) MOM-MOM-09-0338-01B dated 15 June 2009, and Fleet Team Digest article 737NG-FTD-34-09007 dated 09 July 2009, FMC Update U10.8 software should be removed from all 737NG airplanes. In addition, an information notice has been released against U10.8 retrofit bulletin 737-34A2104 to advise operators that U10.8 should not be retrofitted in the 737NG. Operators should reinstall FMC Update U10.7 or the operator's previous FMC software configuration.

Upon deactivation of U10.8, the following Flight Crew Operations Manual (FCOM) and QRH sections are no longer in effect. All other content will apply.

Volume 1

1. Normal Procedures, Amplified Procedures. Section NP21: "Before Start Procedure". The step "Arm VNAV" is not applicable. Arming VNAV on the ground is not authorized with FMC Update U10.7 or earlier.
2. Normal Procedures, Amplified Procedures. Section NP21: "Takeoff Procedure". The procedure associated with arming VNAV on the ground is not applicable.

Volume 2

1. (For revisions dated June 5, 2009 and later) Chapter 11. Section 32: Flight Management Computer. The section "Software Exception Handling Logic" is not applicable.
2. Chapter 11. Section 40: FMC Preflight (Identification Page) Update 10.8 (U10.8)
3. Chapter 11. Section 41: FMC Takeoff and Climb. The following paragraphs from the section "VNAV Armed for Takeoff" are not applicable. Arming VNAV on the ground is not authorized with FMC Update U10.7 or earlier.

   (For revisions dated June 5, 2009 and later)

   "The CDS will annunciate VNAV armed on the FMA when VNAV is selected prior to takeoff and it is capable of being armed. On takeoff and after reaching 400 feet above the runway, the FCC will automatically engage VNAV if armed."

   "To prevent the FCC from engaging on-ground in VNAV SPD mode, if the FCC engages on-ground, the FMC will clear its VNAV valid discrete, which will force the FCC to disengage. The FMC will retain the last valid MCP speed that was above 60 knots that existed prior to the FCC engaging, and will output that as the FMC speed."

   (For revisions dated June 5, 2009 and later)

   "The FMC engine-out mode will not be set when the groundspeed is less than 60 knots. If the engine-out mode is set while on the ground, the FMC will exit the mode when the speed drops below 60 knots. Engine-out speeds will be available if an engine fails on takeoff after 60 knots."

   (For revisions dated June 5, 2009 and later)

   "Prediction displays will be blanked on the MCDU pages when engine failure is detected and airspeed is over 60 knots of ground speed. Route (RTE) data, estimated time of arrival (ETA) data and top of climb (TOC) data displayed on the CDS Navigation Display will be blanked when an engine-out condition has been detected by the FMC. Engine-out will be cleared and the target speed and predictions will return to normal two engine values when the crew selects and EXECutes the ALL ENGINE prompt on the CLB page, or the CRZ or DES phase is entered, or a Flight Complete occurs, regardless of how many engines are running."

   (For revisions dated June 5, 2009 and later)

   "A new FMC CDU message (ENTER EO CRZ SPD AND ALT) will be displayed when the engine-out operation is terminated due to reaching cruise altitude or the pilot depresses the ALL ENGINE prompt button on the climb page."

4. (For revisions dated June 5, 2009 and later) Chapter 11. Section 41: FMC Takeoff and Climb. The following paragraphs from the section “Engine Out Operation” are not applicable.

   • “Improved Engine-Out logic addresses the unintentional initiation of the FMC Engine-Out mode

   • FMC Engine-Out mode will not be set when the groundspeed is less than 60 kt. If Engine-Out mode is set while on the ground, the FMC will exit the mode when the speed drops below 60 kts.

   • Engine-Out speeds will be available if an engine fails on takeoff after 60 knots of ground speed.

   • Predictions will be blanked on the MCDU pages when an engine failure is detected and airspeed is over 60 knots groundspeed. Route (RTE) data, Estimated Time of Arrival (ETA) data and Top of Climb (T/C) data displayed on the CDS Navigation Display will be blanked when an engine-out condition has been detected by the FMC.

   • Engine-out will be cleared and the target speed and predictions will return to normal two engine values when the crew selects and EXECutes the ALL ENGINE prompt on the CLB page, or CRZ or DES phase is entered, or a Flight Complete occurs, regardless of how many engines are running.

   • A new FMC CDU message (ENTER EO CRZ SPD AND ALYT) will be displayed when the Engine Out operation is terminated due to reaching cruise altitude or by the pilot pressing the ALL ENGINE prompt on the climb page.”

5. Chapter 11 Section 60: FMC Messages. The following FMC Alerting Messages are not applicable.

   • ENTER EO CRZ SPD AND ALT

   • INVALID INACTIVE PLAN

   • INVALID MOD PLAN

   • VNAV INVALID-PERF

   (For revisions dated June 5, 2009 and later)

   • FMC DISAGREE (U10.8 and later)

QRH

(Applies to all Revision dates)

1. Maneuvers, Flight Patterns: “Takeoff Procedure”. The procedure associated with arming VNAV on the ground is not applicable. Arming VNAV on the ground is not authorized with FMC Update U10.7 or earlier.

Administrative Information

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-81

IssueDate: March 26, 2010

Subject: Inflight Elevator Tab Vibration

Reason: This bulletin informs 737NG flight crews of the potential for elevator tab vibration that may lead to significant structural damage.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has recently received a report from an operator that the failure of the aft attach lugs on the left elevator tab control mechanism resulted in unwanted elevator vibration during flight. The flight crew diverted from the intended route and made an uneventful landing.

Investigation revealed that the fractured aft attach lugs on the elevator tab control mechanism allowed free-play of the aft end of the mechanism, which in turn allowed movement of the forward end of the elevator tab control rods. The result of this condition was unexpected vibration of the elevator during flight.

Flight crews should be aware that there are many causes of airframe vibration, including free-play in movable surfaces, system or engine malfunctions, and environmental factors. Elevator tab vibration can occur during any phase of flight and is characterized as a clearly noticeable moderate to severe vertical motion in the flight deck and aft cabin. This vibration is characterized as a low frequency vertical vibration in which motion of items attached to airplane structure, such as sun visors, may be noticeable. In some cases, pilots have reported feeling vibration in the control column and rudder pedals as this vertical motion is transmitted through the structure and cables to the controls. If the cause of the vibration is suspected to be due to empennage control surfaces, the discrepancy should be corrected prior to further revenue flight.

Boeing recommends that operators aggressively investigate, identify, and correct the cause of the vibration prior to returning the airplane to revenue service. If exposed to recurrent or chronic vibration, control surfaces can experience significant structural damage.

Operating Instructions

If vibration is suspected due to the elevator tab, reduce airspeed smoothly until the vibration stops, using the thrust levers and pitch attitude. Do not use speed brakes or change airplane configuration to reduce airspeed. Do not reduce airspeed below the minimum speed for the existing flap setting and gross weight. Consider landing at the nearest suitable airport.

Stay at or below the reduced airspeed at which the vibration stopped for the rest of the flight. Limit bank angle to 15° until below 20,000 feet.

Do not deploy the speedbrakes for the remainder of the flight.

Flaps and landing gear can be extended normally during the approach and landing. The speedbrake can be armed for landing.

The vibration occurrence should be reported to maintenance for resolution before further flight. The logbook entry should emphasize that the vibration is suspected to be in the area of the elevator tab and tab control system.

IssueDate: January 10, 2011

Subject: Impact of Arming VNAV on the Ground on the Windshear Escape Maneuver (FMC Update 10.8 and 10.8A)

Reason: This bulletin informs 737NG flight crews of the need to revise the windshear escape maneuver if VNAV has been armed on the ground for takeoff (FMC Update 10.8 and 10.8A).

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During airline simulator evaluations of FMC Update 10.8A, an unintended consequence of arming VNAV for takeoff was discovered with respect to the windshear escape maneuver. If VNAV is armed on the ground, it will remain armed even if TO/GA is pressed below 400 feet AFE in accordance with the windshear escape maneuver. At 400 feet AFE, VNAV will engage and windshear guidance will be lost. TO/GA must be pressed a second time when above 400 feet AFE in order to regain the appropriate windshear guidance.

This condition exists on FMC Update 10.7, 10.8 and 10.8A. Arming VNAV on the ground is not permitted prior to Update 10.8, however.

Boeing and GE are discussing a potential fix for this anomaly in a future FMC software update.

Operating Instructions

Arming VNAV on the ground is not permitted with FMC Update 10.7 or earlier.

With U10.8 or 10.8A installed, if unstable weather conditions are present prior to takeoff, consider not arming VNAV for takeoff.

If VNAV has been armed for takeoff and windshear is encountered, press either TO/GA switch and accomplish the Windshear Escape Maneuver. If windshear conditions continue above 400 feet AFE, press either TO/GA switch a second time when above 400 feet AFE. Verify TO/GA engagement and continue the Windshear Escape Maneuver.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-85 "In Effect" (IE).

This FCOM bulletin will be revised to include Service Bulletin information when available.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207 737

Number: TBC-86 R1

IssueDate: June 5, 2013

Subject: U10.8A FMC Restarts from ATS (Air Traffic Services) or AOC (Aeronautical Operational Control) Datalink issues

Reason: This bulletin informs 737NG/BBJ flight crews of the possibility of the FMC resetting or of the FMC prompt on the MCDU Menu page flashing when using ATS or AOC Datalink.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

ATS Datalink issue:

A condition present in the Update 10.8A FMC software may cause any of the following anomalies:

- FMC software to perform a restart
- Flashing of the FMC prompt on the MCDU Menu page when using ADS
- Significant slowdown of FMC operation.

The condition is due to the FMC retaining unused ADS downlink messages in its Air Traffic message queue. These messages can be erroneously retained in the FMC queue after an unexpected loss of the HF or SATCOM data link between the airplane and the ground.

This condition has been reported to occur during operation of the FMC FANS-1 ATS data link.

The following is required for the condition to occur:

The airplane is equipped with an FMC that has ATS data link functionality enabled in its OPC (Operational Program Configuration) software. If the airplane has logged onto an Air Traffic Services (ATS) connection, the FMC attempts to send an ADS downlink via HF or SATCOM. If the data link transmission medium (either HF or SATCOM) is interrupted and the FMC message is not cleared by the FMC (due to transmission interruption or data conflict between the airplane and ground station) it can remain in the FMC message queue. This can result in very sluggish FMC operation and can possibly result in the FMC performing a software restart.

AOC Datalink issue:

On airplanes with ACARS Management Unit (MU) or Communications Management Unit (CMU), if the VHF radio is used in DATA mode when the airplane is not within the range of the service provider, the automatic ACARS service provider sign-in message will not be acknowledged. The sign-in message will also not be acknowledged when the operator does not have a subscription to an ACARS service provider.

The lack of acknowledgement causes the message to be retained in the FMC queue which may result in flashing of the FMC prompt on the MCDU Menu page or slowdown of FMC operation.

A correction to the software to provide a fix for both conditions is planned for FMC Update U11.

Operating Instructions

To avoid the ATS Datalink condition, do not log onto ATS.

To avoid the AOC Datalink condition, do not use the VHF radio in DATA mode when outside the service range of the ACARS service provider, or if the airline does not have a subscription to an ACARS service provider.

On the ground:

After power up, switch the VHF radio to VOICE mode from DATA mode.

If either problem occurs in flight:

1. Select the VHF radio to VOICE mode from DATA mode
2. Set the FMC Source Select switch to BOTH ON R (if dual FMC installed). This facilitates logging off SATCOM (if installed). The switch can be set back to NORMAL after logging off
3. Logoff the SATCOM system (if installed)
4. If HF datalink is present, select the HF radio to VOICE mode from DATA mode
5. Do not use ATS or AOC Datalink for the rest of the flight

6. Record the event in the logbook for maintenance action prior to next flight to prevent reoccurrence.

Administrative Information

This bulletin replaces bulletin TBC-86 , dated March 25, 2011. Revise the Flight Crew Operations Manual Bulletin Record Page to show bulletin TBC-86 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record Page to show bulletin TBC-86 R1 "In Effect" (IE).

This FCOM bulletin will be revised to include Service Bulletin information when available.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Number: TBC-88 R2

IssueDate: November 16, 2012

Subject: Impact of Automatic Approaches in 737NG airplanes with Fail-Operational Autoland option into ILS Runway 34, Kagoshima Airport, Japan

Reason: This bulletin informs flight crews operating 737NG airplanes with the Fail-Operational Autoland option of the potential for a hard landing or for significant deviations from the glide slope if pitch oscillations are ignored and the autopilot(s) are left engaged for approach and autoland.

This bulletin has been revised to include information about a software update that will correct this anomaly.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

An operator advised Boeing that the Japanese Civil Aviation Bureau (JCAB) investigated all airlines flying 737NG into Kagoshima (RJFK/KOJ) airport runway 34. Two operators have informed Boeing that several of their 737NG aircraft experienced anomalous pitching motions while on ILS approach into KOJ runway 34.

During single or dual A/P ILS approaches on 737NG airplanes with the Fail-Operational Autoland option, the pre-runway terrain at Kagoshima Airport ILS runway 34 causes an underdamped system response starting around 1400 ft RA.

During these autopilot approaches, around 1000ft AFE (Above Field Elevation) the flight crew may experience GS deviation alerts on the PFD (Glide Slope Pointer and Deviation Scale turns amber and the pointer flashes), illumination of the amber BELOW G/S alert light, vertical speed in excess of 900 ft/min (together with a possible GPWS SINK RATE alert) and 5 deg or more pitch attitude variations.

P/N 227B-COL-AC1-08 software (commonly referred to by Boeing and Rockwell Collins as the P7.0 software) was developed primarily to improve in-service issues encountered by 737NG airplanes with the Fail-Operational Autoland option installed when performing approaches over abrupt terrain variations. If the P7.0 software has been installed, 737NG airplanes with the Fail-Operational Autoland option are capable of performing autopilot approaches below 1000 feet AFE to Kagoshima Airport ILS runway 34.

The P7.0 software update was installed in production at airplane line number 4122, and then at line number 4151 and on. Airplane line number 4122 delivered in July 2012; airplane line number 4151 delivered in August 2012. Authorization for retrofit for earlier line numbers is available.

Operating Instructions

Boeing does not recommend the use of single or dual channel approaches on 737NG airplanes with the Fail-Operational Autoland option below 1000 ft AFE (Above Field Elevation) for approaches to ILS runway 34 at Kagoshima Airport (RJFK/KOJ), Japan, if the P/N 227B-COL-AC1-08 software (P7.0 software) has not been installed.

Flight director (F/D) only, raw data or Head-Up Guidance (HUD) approaches have no restrictions.

737NG airplanes with the Fail Passive Autoland option will perform approach and autoland acceptably at Kagoshima Airport ILS runway 34.

Those operators who intend to include Kagoshima into their route shall seek regulatory approval based on this bulletin.

Administrative Information

This bulletin replaces bulletin TBC-88 R1 , dated November 23, 2011. Revise the Bulletin Record Page to show bulletin TBC-88 R1 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record Page to show bulletin TBC-88 R2 "In Effect" (IE).

This bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been retrofit with the P7.0 software.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-89 R1

IssueDate: January 9, 2015

Subject: Reduced Engine Response Times

Reason: This bulletin informs 737NG flight crews of slow engine acceleration following thrust reduction at cruise altitude due to a recent EEC software update. The bulletin provides suggested techniques to help prevent excessive airspeed loss.

This bulletin has been revised to provide CFMI Service Bulletin information for EEC software version 7.B.W.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received pilot reports of slow engine acceleration at high altitudes (above FL300) which have resulted in airspeed losses as high as 20 to 30 knots. These reports indicate the events have occurred after thrust is reduced and immediately re-applied. When an airplane experiences an abrupt airspeed increase at high altitude, as might be experienced when encountering a mountain wave, the engine will decelerate to a lower N1 and take longer to accelerate back to full or normal power than is desired.

Analysis of these reports indicates that this is related to the Electronic Engine Control (EEC) software revisions 7.B.U1 and 7.B.V2. Revision 7.B.U1 reduced the engine deceleration and acceleration rates for specific thrust lever transients at high altitude. Revision 7.B.V2 returned the deceleration rate back to normal but retained the reduced acceleration rate. Both versions of the EEC software reduce engine acceleration rate if the throttles are in idle for less than 60 seconds. Slowing the acceleration rate of a heat soaked engine improves engine operability (stall margin) characteristics.

The first software revision was introduced into the 737NG fleet in July 2009 and affects all 737NG airplanes with EEC software version 7.B.U1 or 7.B.V2.

EEC software version 7.B.W is now available from CFMI. When both engines are providing ECS bleed air to the airplane, 7.B.W restores the high altitude accelerations rates to the same rates that were present prior to the reduction introduced in 7.B.U1.

Operating Instructions

Until 7.B.W software is installed, pilots may want to use the following techniques to avoid excessive speed loss due to slow engine acceleration:

1. Use the autopilot and autothrottle as much as possible.
2. When established at cruise altitude, manually select either CLB or CONT on the FMC N1 Limit page. This will ensure maximum available thrust.
3. If the airplane experiences a sudden increase in airspeed that causes the autothrottle to reduce thrust, manually guard the thrust levers to maintain a minimum of 60% N1, if possible. If thrust is reduced below 60% N1, a significantly longer time will be required for the engines to spool up if the time at idle thrust is less than 60 seconds.
4. If the airplane experiences a sudden increase in airspeed, consider using smooth extension of the speed brakes to increase drag and to avoid large thrust reductions.
5. No specific crew actions are needed if the thrust remains at idle for longer than 60 seconds or if the descent is to an altitude below FL300. Normal engine acceleration can be expected in these cases.

Administrative Information

This bulletin replaces bulletin TBC-89 , dated October 1, 2012. Revise the Flight Crew Operations Manual Bulletin Record Page to show bulletin TBC-89 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual. Amend the Bulletin Record to show bulletin TBC-89 R1 "In Effect" (IE).

This FCOM bulletin will be cancelled when an operator reports EEC software version 7.B.W has been installed via the applicable CFMI Service Bulletins on all 737NGs in their fleet.

The applicable CFMI Service Bulletins are:

·CFM56-7B S/B 73-0204 “ENGINE FUEL AND CONTROL - Electronic Control Unit (73-21-60) - New Software Versions 7.B.WF3 for SAC and DAC Engines and 7.B.WF2 for SAC Engines” or

·CFM56-7B S/B 73-0203 “ENGINE FUEL AND CONTROL - Electronic Control Unit (73-21-60) - New Software Version 7.B.WF2 for DAC Engines”

Boeing Service Letter 737-73-013-U provides additional information.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-90 R1

IssueDate: January 14, 2013

Subject: Thrust Instability Events

Reason: This bulletin informs 737NG flight crews of the possibility of encountering an engine Thrust Instability Event (TIE). The bulletin provides background information and operating instructions to consider when such an event is encountered.

This bulletin has been revised to provide additional information. The operating instructions have been expanded to allow an engine restart in accordance with non-normal checklist guidance after encountering a TIE if deemed necessary.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Since 2008, a small number of 737NGs operated by three airlines have experienced Thrust Instability Events (TIE). Investigation has led Boeing, GE/CFMI and other specialists involved to suspect intermittent fuel contamination as the most likely, prevailing causal factor.

TIE characteristics of transient thrust oscillations are as follows:

- The thrust instability events can be identified as N1 or N2 oscillations, sometimes resulting in overspeeds. In some cases, rollbacks to sub-idle have been observed after crews retard the thrust to idle during application of memory steps. Data review of the events has shown that retarding the thrust lever to the mid range has supported avoidance of sub-idle exposure and potential engine shutdown.
- Engine parameters fluctuate and generally follow thrust lever movement.

- Events do not result in sustained, un-commanded, upward thrust runaways.
- The difference between Thrust Instability Events and surges is that a surging engine will not exceed the commanded thrust setting, whereas an engine experiencing thrust instability will oscillate both above and below the commanded thrust.

TIE events to date have the following common characteristics:

- All airplanes were fueled at Seattle Tacoma (SEATAC) airport within the month prior to the event.
- Fuel was being supplied from the wing tanks during the events.
- Most events occurred during climb in a non-critical phase of flight. No event has occurred during takeoff or approach.
- Events have not shown to cause engine damage. Therefore, a restart in accordance with the non-normal checklist can be attempted on engines which are shutdown or ran sub-idle.

The root cause of these events is still under investigation, and further information will be provided as soon as a permanent solution is determined.

Operating Instructions

Operators and flight crews should consider the following techniques to appropriately mitigate these events:

- Accomplish the Engine Limit or Surge or Stall non-normal checklist. During the memory items, retard the thrust lever continuously and smoothly, rather than incrementally and/or rapidly. Analysis has shown that gradual thrust lever movement may reduce the duration of the event. During critical flight phases, controlling the airplane is the first priority.
- Allow sufficient time for the affected engine to stabilize prior to making a decision whether to shut down the engine.
- When the engine recovers, smoothly and deliberately advance the thrust levers to attain the desired airspeed.
- If an engine was shut down during a Thrust Instability Event, a restart may be attempted in accordance with the non-normal checklist guidance.

Administrative Information

This bulletin replaces bulletin TBC-90 , dated December 10, 2012. Revise the Bulletin Record Page to show bulletin TBC-90 as “CANCELLED” (CANC).

Insert this bulletin behind the FCOM Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-90 R1 "In Effect" (IE).

This FCOM bulletin will be revised to include Service Bulletin information when available.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-92 R1

IssueDate: January 9, 2015

Subject: Thrust Shortfall Condition Caused by Electronic Engine Control (EEC) Software Version 7BV4

Reason: This bulletin informs 737NG flight crews of the possibility of encountering an engine thrust shortfall during the setting of takeoff thrust due to inadvertent activation of the ground over-thrust protection logic in EEC software version 7BV4. The bulletin provides background information and operating instructions to consider when such an event is encountered.

This bulletin has been revised to provide CFMI Service Bulletin information for EEC software version 7.B.W.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

In September 2013, EEC software version 7BV4 was introduced to help maintain thrust during Thrust Instability Events (TIE). As part of the EEC 7BV4 software upgrade, the logic that prevents engine over-thrust on the ground if the engine experiences an upward thrust runaway was also revised.

In some rare instances, and on the ground only, this ground over-thrust protection logic is erroneously triggered during engine start. This will result in a thrust shortfall on the affected engine when the thrust levers are advanced for takeoff. The affected engine will exhibit noticeably slower N1 response and as much as a 35% reduction in N1 (up to a 60% thrust loss) compared to the takeoff thrust target.

In an attempt to provide the demanded thrust, the autothrottle advances the thrust lever of the affected engine further than that of the good engine. This results in a thrust lever split of 1- to 2-knob widths. The engine indications will clearly show the thrust shortfall condition, and the tactile yaw of the airplane due to asymmetric thrust will be obvious.

Since September 2013, four 737NGs with 7BV4 installed have experienced this thrust shortfall on one engine during the takeoff roll prior to 60 knots. Three events resulted in a rejected takeoff, while the fourth event resulted in an air turn back after the takeoff was continued. If the takeoff is continued with the thrust shortfall, performance targets may not be met, and in flight, the thrust shortfall will continue and will not be able to be eliminated by normal crew action.

The possibility for this thrust shortfall condition has only been identified with EEC software version 7.B.V4; prior software versions are not affected.

EEC software version 7.B.W is now available from CFMI. 7.B.W introduced modifications which will inhibit erroneous activation of this logic while the engines are sub idle.

Operating Instructions

The Flight Crew Operations Manual (FCOM) Takeoff Procedure directs both the Pilot Flying (PF) and the Pilot Monitoring (PM) to verify that the correct takeoff thrust is set. The PM monitors engine instruments during the takeoff roll and calls out any abnormal indications.

If a thrust abnormality, as described above, is encountered during the takeoff roll, the takeoff should be rejected. Controlling the thrust levers manually will not fix the thrust shortfall.

The affected engine response can be expected to be slower during the rejected takeoff maneuver. Some thrust asymmetry can be anticipated during thrust reverser operation.

Maintenance action should be taken after this malfunction.

Administrative Information

This bulletin replaces bulletin TBC-92 , dated January 30, 2014. Revise the Flight Crew Operations Manual Bulletin Record Page to show bulletin TBC-92 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-92 R1 "In Effect" (IE).

This FCOM bulletin will be cancelled when an operator reports EEC software version 7.B.W has been installed via the applicable CFMI Service Bulletins on all 737NGs in their fleet.

The applicable CFMI Service Bulletins are:

·CFM56-7B S/B 73-0204 “ENGINE FUEL AND CONTROL - Electronic Control Unit (73-21-60) - New Software Versions 7.B.WF3 for SAC and DAC Engines and 7.B.WF2 for SAC Engines” or

·CFM56-7B S/B 73-0203 “ENGINE FUEL AND CONTROL - Electronic Control Unit (73-21-60) - New Software Version 7.B.WF2 for DAC Engines”

Boeing Service Letter 737-73-013-U provides additional information.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-93

IssueDate: April 1, 2014

Subject: Airspeed Low Aural Alert Anomaly

Reason: This bulletin informs 737NG flight crews of the possibility that the Airspeed Low aural alert may not sound even though airspeed has decreased into the amber band.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

On the 737NG, the airspeed readout box surrounding the current airspeed changes to amber and flashes for 10 seconds when current airspeed decreases 30% or more into the minimum maneuver speed amber band. If the condition persists after ten seconds, the readout box changes color to solid amber until the airspeed is greater than the top of the amber band. On airplanes equipped with the Airspeed Low aural alert, the voice alert annunciates "Airspeed Low, Airspeed Low" at the onset of the condition.

Flight testing has shown that on those airplanes equipped with the Honeywell Mark V-A (MKV-A) EGPWS Software Part Number 69000940-101, the Airspeed Low aural alert may not sound even though airspeed has decreased into the amber band. The airspeed box turns amber reflecting a drop in airspeed 30% or more into the amber band with no corresponding aural alert.

This anomaly can only be present if the airspeed decreases into the amber band while the amber band is rising, e.g., during flap/slat retraction, turbulence, change in load factor, etc. The crew may not receive the Airspeed Low aural alert although the current speed is below the threshold for the alert.

The Honeywell Mark V-A (MKV-A) EGPWS Software Part Number 69000940-101 was installed on Production Line Number 4763 (delivered January 2014), and on Production Line Number 4777 and on. Honeywell plans to issue EGPWS Software Part Number 69000940-102 to correct this condition.

Operating Instructions

Flight crews should monitor airspeed during all phases of flight and call out deviations or changes to instruments during all conditions. If installed, the Air Speed Low aural is a supplemental means of awareness to the visual indication represented to the flight crew on the primary flight display. With or without the Airspeed Low aural, flight crews are expected to monitor the airspeed and call out any unplanned or unexpected deviations in accordance with the Stabilized Approach Criteria and Recommended Callouts listed in the Flight Crew Training Manual.

Crew response to an airspeed low condition will be same with or without the aural alert. At the onset of this condition, flight crews are expected to promptly correct the airspeed to increase the speed above the amber band as indicated on the Primary Flight Display.

Crews should be especially observant of airspeed when operating near or in the amber minimum maneuver speed band.

Administrative Information

Insert this bulletin behind the FCOM Bulletin Record Page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record Page to show bulletin TBC-93 "In Effect" (IE).

This FCOM bulletin will be cancelled when an operator reports to Boeing that the Honeywell EGPWS Software Part Number 69000940-102 has been installed on all affected 737NGs in their fleet.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-97 R2

IssueDate: September 19, 2016

Subject: Window Heat Control Unit (WHCU) Initialization Indications

Reason: A new WHCU will be installed on 737NG airplanes at line number 5830 and on. This new WHCU goes through an initialization process when the WINDOW HEAT switches are selected to ON. The initialization process produces indications that could be misinterpreted as abnormal.

This bulletin is being revised to update the functionality of the WHCU during electrical power transfers, and to update the affected line numbers.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Selection of the WINDOW HEAT switches to the ON position places the new WHCU into an initialization process. The amber window OVERHEAT lights illuminate along with the two master caution lights and the amber ANTI-ICE light on the system annunciator panel because during the initialization process electrical power is not being applied to the windows.

After the initialization process completes, in approximately 3 seconds, the amber window OVERHEAT lights, the two master caution lights, and the amber ANTI-ICE light on the system annunciator panel extinguish. The green window heat ON lights also illuminate.

The illumination of these amber lights during the initialization process does not change the function of the OVERHEAT light during an overheat or loss of electrical power.

Additionally, selecting a different source of electrical power with the WINDOW HEAT switches in the ON position can potentially illuminate the amber window OVERHEAT lights due to electrical current spikes.

The affected WHCU, Boeing Part # 10-61833-8, will be installed on 737NG airplanes from line numbers 5830 to 6029. Airplanes from line number 6030 and on will be delivered with an updated WHCU, Boeing Part # 10-61833-9.

Operating Instructions

The functionality of the new WHCU will affect the following procedures:

Normal Procedures - NP.21

- Preflight Procedures - First Officer

Supplementary Procedures - SP.3

- Window Heat System Tests

Quick Reference Handbook - QRH 3

- WINDOW OVERHEAT

If the window OVERHEAT lights extinguish within 5 seconds of turning the window heat ON, the WHCU is operating normally.

In order to make it easier to differentiate the temporary differences in these procedures, a revision bar has been used.

The above procedures are amended as follows until the WHCU is updated with Boeing Part # 10-61833-9.

NP.21 - PREFLIGHT PROCEDURE - FIRST OFFICER

WINDOW HEAT switches .... ON

Position switches ON at least 10 minutes before takeoff.

Verify the OVERHEAT lights extinguish within 5 seconds.

Note: The master caution and ANTI-ICE system annunciator lights can illuminate.

Verify that the ON lights are illuminated (except at high ambient temperatures).

SP.3 - WINDOW HEAT SYSTEM TESTS

Overheat Test

The overheat test simulates an overheat condition to check the overheat warning function of the window heat system.

WINDOW HEAT switches .... ON

Verify the OVERHEAT lights extinguish within 5 seconds.

Note: The master caution and ANTI-ICE system annunciator lights can illuminate.

WINDOW HEAT TEST switch .... OVHT

OVERHEAT lights - ON

On lights - Extinguish

Lights extinguish after approximately 1 minute.

MASTER CAUTION - ON

ANTI-ICE system annunciator - ON

WINDOW HEAT switches .... Reset

Position the WINDOW HEAT switches OFF, then ON.

Verify the OVERHEAT lights extinguish within 5 seconds.

Note: The master caution and ANTI-ICE system annunciator lights can illuminate.

Power Test

The power test verifies operation of the window heat system. The test may be accomplished when any of the window heat ON lights are extinguished and the associated WINDOW HEAT switch is ON.

WINDOW HEAT switches .... ON

Verify the OVERHEAT lights extinguish within 5 seconds.

Note: The master caution and ANTI-ICE system annunciator lights can illuminate.

Note: Do not perform the power test when all ON lights are illuminated.

WINDOW HEAT TEST switch .... PWR

The controller is forced to full power, bypassing normal temperature control. Overheat protection is still available.

WINDOW HEAT ON lights .... Illuminated

If any ON light remains extinguished, the window heat system is inoperative. Observe the maximum airspeed limit of 250 kts below 10,000 feet.

QRH 3 - WINDOW OVERHEAT

Condition: A window overheat occurs.

1. WINDOW HEAT switch (affected window) .... OFF
2. **Wait** 2 - 5 minutes.
3. WINDOW HEAT switch (affected window) .... ON
4. **Wait** 5 seconds

   Note: The master caution and ANTI-ICE system annunciator lights can illuminate.

5. Choose one:

   Window OVERHEAT light **stays extinguished:**

   Continue normal operation.

   (End of Checklist)

   Window OVERHEAT light **illuminates again:**

   Go to step 6

6. WINDOW HEAT switch (affected window) .... OFF

   Limit airspeed to 250 knots maximum below 10,000 feet.

7. Pull both WINDSHIELD AIR controls. This vents conditioned air to the inside of the windshield for defogging.

   (End of Checklist)

For illumination of the amber window OVERHEAT lights following electrical power transfers, the crew should cycle electrical power to the affected window by completing the above WINDOW OVERHEAT non-normal checklist.

Administrative Information

This bulletin replaces bulletin TBC-97 R1 , dated April 4, 2016. Revise the Flight Crew Operations Manual Bulletin Record Page to show bulletin TBC-97 R1 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-97 R2 "In Effect" (IE).

This FCOM bulletin will be cancelled when the operator reports to Boeing that all the airplanes in their fleet between line numbers 5830 and 6029 have been retrofitted with the updated WHCU, Boeing Part # 10-61833-9.

Airplanes from line number 6030 and on will be delivered with an updated WHCU, Boeing Part # 10-61833-9. These WHCUs will not necessitate the use of the procedures outlined in this bulletin.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-98

IssueDate: April 28, 2016

Subject: NPS Scales Mask ILS/GLS Localizer and Glideslope Fail Flags

Reason: This bulletin informs 737NG flight crews that the ILS/GLS Localizer (LOC) and Glideslope (GS) fail flags are masked by the Navigation Performance Scales.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Operators with the Navigation Performance Scales (NPS) option need to be aware that if there is an internal failure of the ILS or GLS component of the Multi-Mode Receiver (MMR), the LOC and/or G/S flags are masked by the NPS scales on the failed side Primary Flight Display (PFD).

There are some failures in the ILS /GLS component of the MMR, that cause the station identifier or ILS frequency/GLS channel to remain displayed in the approach reference section of the PFD despite the failure. The aural identifier may or may not be available. However, the anticipation cues (ghost pointers) are not displayed with any type of failure of the ILS/GLS component in the MMR. The approach mode (APP) is still capable of being armed, although it does not capture if the master flight director is on the failed side.

Operating Instructions

Operators with the NPS option should emphasize to their flight crews, the importance of confirming that the localizer and glideslope pointers are shown when preparing to execute an ILS/GLS approach, in accordance with ILS or GLS Landing Procedure in the FCOM. In addition, the anticipation cues should be confirmed to be in view as well. If an MMR failure is suspected, set the EFIS mode selector to APP to confirm the LOC and/or G/S fail flags are shown on the Navigation Display (ND). When a failure of the ILS or GLS component of the MMR is confirmed, select an approach other than an ILS or GLS.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-98 "In Effect" (IE).

This anomaly will be corrected with CDS BP15, currently scheduled for release in mid-2016.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company **Seattle, Washington 98124-2207**	**737**

Number: TBC-99

IssueDate: July 1, 2016

Airplane Effectivity: 737-600/700/800/900 and BBJ Airplanes with U10.2 through U12 FMC Operational Software.

Subject: Incorrect FMC Speed/Altitude Constraints following a runway change with a Standard Terminal Arrival (STAR) and the previous runway already executed in the FMC

Reason: To inform crews on this subject and to provide guidance.

> Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

An operator reported that during an arrival with a valid STAR and runway active in the FMC flight plan, the landing runway was changed by Air Traffic Control (ATC). After the runway change was made in the FMC, the crew noticed that the waypoint constraints associated with the new RWY selection were incorrect. The FMC software did not automatically update the speed and altitude constraints associated with the new RWY selection in the FMC, with a valid STAR/RWY combination active in the FMC flight plan. The speed/altitude constraints associated with the initial STAR and previous runway assignment remained in the active flight plan.

This results with incorrect waypoint constraints in the FMC flight plan for the STAR with the selection of a new RWY.

This condition was introduced in U10.2 and is present in all versions of FMC software from U10.2 through U12.

Operating Instructions

This condition can be resolved by re-selecting and executing the existing STAR, after the new RWY has been selected in the FMC. This method is less of a workload than manually inserting each waypoint speed/altitude constraint into the FMC. In the event it is not possible to re-enter the STAR, because the airplane is already established on a segment of the ATC-issued STAR, manual entry of each waypoint speed/altitude constraint into the FMC may be necessary. Regardless of which method is used to overcome this situation, it is critical that the pilots carefully review all airspeed and altitude constraints associated with a STAR and RWY, when either are entered or changed in the FMC flight plan.

This anomaly will be corrected in FMC software update U13.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record Page to show bulletin TBC-99 "In Effect" (IE).

This anomaly will be corrected in FMC software update U13.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-100

IssueDate: October 17, 2016

Subject: NAV Display Blanking/Blinking After Installation of Common Display System (CDS) BP15

Reason: To Make Flight Crews Aware of Potential NAV Display Blanking/ Blinking with the Installation of Common Display System (CDS) BP15.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During bench testing of the Common Display System (CDS) software BP15, a combination of conditions were discovered which may cause some Display Units (DUs) to blank or blink.

This situation may manifest itself when all of the following conditions are met:

1. Two (2) functioning Display Electronics Units (DEUs).
2. DISPLAY SOURCE selector is set to AUTO.
3. Six (6) functioning Display Units (DUs).
4. Captain's ND shows MAP with Vertical Situation Display (VSD) selected on the Left Inboard DU.
5. Captain's MAIN PANEL DU and LOWER DU Display selector set to NORM.
6. First Officer's ND shows MAP with VSD selected on the Right Inboard DU.
7. First Officer's MAIN PANEL DU selector set to NORM and LOWER DU Display selector set to ND.

If all of the conditions above are met, and depending on the DEU equipment installed, one of the following anomalies may result:

A. The First Officer’s Right Inboard DU and Lower Center DU will blank or blink, or

B. The First Officer’s Right Inboard DU and Lower DU map background data will freeze or not appear, and the MAP fail flag will appear if the problem persists for more than 30 seconds.

If any of the seven (7) conditions is not met, the Display Units (DUs) will stabilize and the anomaly will stop.

Operating Instructions

On airplanes with CDS BP15 and VSD selected on the inboard DUs by both pilots, the First Officer should not select ND on the lower center display unit to avoid this situation.

Research is being conducted to confirm the root cause of this anomaly. Once the root cause is confirmed, this bulletin will be updated as necessary.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual. Amend the Bulletin Record to show bulletin TBC-100 "In Effect" (IE).

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-101 R1

IssueDate: December 19, 2016

Subject: Cabin Pressurization Panel Blanking/Dimming Issues

Reason: To inform the crew of failures of the Cabin Pressurization Panel where the indications flicker, become too dim to read, or completely blank.

This bulletin is being revised to update the flight crew procedure in the event the FLT ALT needs to be changed to a higher altitude than the current setting due to a change in cruise altitude.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

The Cabin Pressurization Panel was redesigned to replace obsolete components and was introduced on the 737NG in April 2013 beginning with line number 4413. Similar to the previous panels, it includes three displays: the FLT ALT indicator, LAND ALT indicator, and the outflow Valve Position Indicator, all of which now use LED lighting technology.

Several operators have reported occurrences where the new LED display indications either flicker, become too dim to read, or completely blank. Most of the blanking reports indicate a self-recovery of the panel after a short duration of time. The duration of the effects can vary but it is typically momentary.

The cause of these occurrences is still under investigation by the manufacturer of the Cabin Pressurization Panel but early testing points to possible Electromagnetic Interference (EMI).

The Cabin Pressurization Panel is supplied by United Technologies (UTAS) and is P/N 1019439-1-001, equivalent Boeing P/N is 10-62231-31.

Boeing is working with UTAS to determine the cause of the Cabin Pressurization Panel failures. Once the cause of the problem and the appropriate fix is confirmed it will be introduced at the factory for new airplanes. For airplanes already in service Boeing will communicate appropriate fix instructions.

Currently only the first line number is known for the affected airplanes, 4413. Once the line number for the last affected airplane is determined this FCOM bulletin will be revised. Also included in the revision will be confirmation of the cause of the Cabin Pressurization Panel failures and a time line for the fix.

Operating Instructions

If the Cabin Pressurization Panel display indications flicker, become too dim to read, or completely blank, it is important to note that the pressurization system will function as initially set by the crew. Cabin Pressurization Panel changes do not need to be made if a failure occurs and crew action is not needed or recommended.

If a Cabin Pressurization Panel failure occurs the crew should follow operator specific procedures or policies for reporting the failure.

The following action should be taken:

On the ground:

Do not takeoff.

In flight:

The Cabin Pressurization Panel failure should be momentary. Allow the Cabin Pressurization Panel to self-recover.

If the Cabin Pressurization Panel self-recovers, continue normal operation.

If the Cabin Pressurization Panel does not self-recover, avoid flight plan amendments requiring a change to the FLT ALT or LAND ALT on the Cabin Pressurization Panel.

If a situation requires a change on the Cabin Pressurization Panel to FLT ALT and the display is not visible:

Do not attempt to change the FLT ALT.

If the FLT ALT needs to be changed to a lower altitude than the current setting due to a change in cruise altitude:

No crew action is required. Operate the airplane at the new lower cruise altitude.

If the FLT ALT needs to be changed to a higher altitude than the current setting due to a change in cruise altitude:

No crew action is required. Operate the airplane at the new higher cruise altitude.

Note: Flying above the selected FLT ALT will drive the cabin to the maximum differential pressure. When the maximum cabin differential pressure is reached, the automatic control system will prioritize limiting differential pressure and will stop controlling cabin rate. If the airplane climbs after the maximum differential pressure is reached, the cabin rate will equal the airplane rate.

If a situation requires a change on the Cabin Pressurization Panel to LAND ALT and the display is not visible:

Do not attempt to change the LAND ALT.

Manually control cabin altitude when below 10,000 feet MSL or 3,000 feet above airport elevation, whichever is higher.

Landing must be accomplished with the airplane unpressurized.

Follow guidance provided in the Supplementary Procedures chapter of the Flight Crew Operations Manual (FCOM). Refer to SP.2, Air Systems, Manual Mode Operation.

Note: Verify desired outflow valve movement with changes on the cabin altimeter/differential pressure indicator and the cabin rate of climb indicator.

Administrative Information

This bulletin replaces bulletin TBC-101 , dated October 21, 2016. Revise the Flight Crew Operations Manual Bulletin Record Page to show bulletin TBC-101 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-101 R1 "In Effect" (IE).

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-102

IssueDate: December 16, 2016

Airplane Effectivity: **B737-600/700/800/900 and BBJ Airplanes with existing FMC Software including Update U13 (scheduled to be released April 2017).**

Subject: Incorrect FMC Constraint Altitude on a Standard Terminal Arrival Route (STAR) with a Common Waypoint, after Selection of another Approach

Reason: To inform crews about the incorrect FMC Constraint Altitude, when selecting another approach that has a common waypoint with the original STAR in the active flight plan.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

For airplanes with the existing FMC Software, including Update 13, when a selected approach is changed to another approach that has a common waypoint with the original STAR, the FMC will use the higher constraint altitude for the common waypoint.

Operating Instructions

When a selected approach is changed for another approach that has a common waypoint with the original STAR, verify the waypoint constraint altitude after changing the selected approach.

This anomaly will be corrected in FMC software update U14.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-102 as "In Effect" (IE).

This anomaly will be corrected in FMC software update U14.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-103

IssueDate: April 17, 2017

Airplane Effectivity: B737-600/700/800/900/BBJ Airplanes with FMC Software U11/U12/U13 installed

Subject: VNAV INVALID-PERF Scratchpad Message

Reason: To inform the Flight Crews of an anomaly in which the VNAV INVALID-PERF scratchpad message cannot be cleared unless an approach is selected in the active flight plan.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During a Boeing flight test the following software exception error was discovered. When certain forecast wind data is entered into the DES FORECAST page and no approach is selected in the active flight plan, FMC predictions stop, VNAV disengages, the VNAV INVALID-PERF scratchpad message shows and the FMC Alert Lights illuminate. This software exception causes the Cost Index (CI) to be replaced with box prompts on the PERF INIT page. The corrective action for VNAV INVALID-PERF scratchpad message is reentering the CI using either the previous or a new value on the PERF INIT page. Following the CI reentry, activating the data modification by pushing the execute (EXEC) key will restart FMC predictions and allow the crew to reengage VNAV.

However, it was discovered that with certain winds entered on the DES FORECAST page, it may not be possible to reenter a CI value on the PERF INIT page until an approach is selected into the active flight plan.

Note: The exact wind data entries that will trigger this anomaly are not known at this time.

Operating Instructions

When wind data is entered into the DES FORECAST page with no approach selected in the active flight plan, and the VNAV INVALID-PERF scratchpad message is shown in flight, an approach should be entered into the active flight plan. This should be followed by reentering the original CI or a new CI on the PERF INIT page. Afterwards, activating the data modification by pushing the execute (EXEC) key will restart FMC predictions and allow the crew to reengage VNAV.

The inability to reenter a CI if the VNAV INVALID-PERF scratchpad message is shown, can be avoided if an approach is selected in the active flight plan prior to the FMC-calculated Top of Descent (TOD), or if winds are not entered on the DES FORECAST page.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-103 as "In Effect" (IE).

This anomaly will be corrected in FMC Software Update U14, scheduled to be released in the second quarter of 2019. This FCOM Bulletin will be revised to include Service Bulletin information when available.

This Bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been retrofitted with FMC Software U14.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-105 R1

IssueDate: June 26, 2018

Subject: Integrated Approach Navigation (IAN) Anomaly with Localizer Backcourse Approaches

Reason: To inform flight crews operating the 737NG with the Fail-Operational Autoland option of the potential for unexpected deviations or roll oscillations during localizer backcourse approaches flown using IAN.

This bulletin is being revised to update affected airplanes and the FCC software that will correct the anomaly, and to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

During 737-8 flight test, while flying a backcourse localizer approach into Idaho Falls (KIDA) Runway 2, the airplane momentarily deviated from the centerline, causing the localizer deviation alert to activate (localizer pointer and deviation scale turn amber and the pointer flashes).

An analysis of the event identified a problem with the runway heading filter. The filter does not correctly account for the 180-degree difference between the course being flown and the MCP selected course during a localizer backcourse approach flown using IAN, on aircraft equipped with the Fail Operational Autoland option and Flight Control Computer (FCC) OPS P10.0 and earlier. Engineering has determined that this anomaly is possible on the 737NG as well as the 737-8.

During these approaches the autopilot/flight director system may command momentary deviations from the localizer backcourse centerline of up to approximately 3/4 of a dot after becoming established on approach, causing the localizer deviation alert to activate.

This anomaly is only possible on 737NG airplanes which have the Fail Operational Autoland and IAN options installed, have FCC OPS P10.0 or earlier, and are prior to Line Number 7154. The runway heading filter issue is expected to be corrected for retrofit with FCC OPS P11.1, scheduled for release in 3Q2018.

Operating Instructions

Do not fly a localizer backcourse approach using IAN until the runway heading filter has been corrected with the installation of FCC OPS P11.1.

Administrative Information

This bulletin replaces bulletin TBC-105 , dated April 25, 2017. Revise the Flight Crew Operations Manual Bulletin Record Page to show bulletin TBC-105 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-105 R1 as "In Effect" (IE).

This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been retrofitted with the FCC OPS P11.1 software. Retrofit information will be provided by Service Bulletin 737-22A-1322 which is scheduled for release in 3Q2018.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-106

IssueDate: May 3, 2017

Airplane Effectivity: B737-600/700/800/900/BBJ with Overrun Warning (ORW) system installed

Subject: Overrun Warning (ORW) System Restriction if a Landing Runway is Not Selected or Available n the FMC

Reason: To inform flight crews to inhibit the ORW system if a landing runway is not selected in the FMC and the runway condition is less than dry.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Testing of the ORW system revealed that if a landing runway is not selected in the FMC ARRIVALS page, the ORW system will only use a DRY runway condition in the system's calculation of landing distance. Thus, if the pilot selects a runway condition that is less than DRY on APPROACH REF Page 2/2 without also selecting a landing runway, the ORW system calculation will not compute properly for the degraded runway condition.

Operating Instructions

Select a landing runway in the FMC. If a landing runway is not available in the FMC and the runway condition is less than DRY, disable the ORW system in accordance with the Overrun Warning (ORW) System Inhibit Operation supplementary procedure.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-106 as "In Effect" (IE).

This anomaly will be corrected in FMC Software Update U14, scheduled to be released in the second quarter of 2019. This FCOM Bulletin will be revised to include Service Bulletin information when available.

This FCOM Bulletin will be cancelled after Boeing is notified that all affected airplanes in your fleet have been retrofitted with FMC Software U14.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-107

IssueDate: July 17, 2017

Airplane Effectivity: B737-600/700/800/900/BBJ Airplanes

Subject: ADIRU P/N HG2050BC02 Position Drift and Ground Speed Errors

Reason: To inform flight crews of potential ADIRU position drift and ground speed errors when ADIRU P/N HG2050BC02 is installed.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports from several 737NG operators of ADIRU position drift and ground speed errors in airplanes equipped with ADIRU P/N HG2050BC02. The root cause of these drift and groundspeed errors has been identified as a reduced accuracy performance caused by a software error in the ADIRU P/N HG2050BC02. The reduced accuracy performance errors are cumulative and increase if the ADIRU goes through a full alignment multiple times during the course of daily operations. The following FMC Alerting messages can be experienced as the drift and ground speed errors increase:

Airplanes with FMC update U10.0 to U10.6:

- “VERIFY POSITION”, or
- “UNABLE REQD NAV PERF – RNP”,

Airplanes with FMC update U10.7 to U10.8A:

- “VERIFY POSITION”,
- “UNABLE REQD NAV PERF – RNP”,
- “IRS POS/ORIGIN DISAGREE”,
- “VERIFY POS: IRS-FMC”,
- “VERIFY POS: IRS-IRS”.

Airplanes with FMC update U11 and onwards:

- "VERIFY POSITION",
- "UNABLE REQD NAV PERF – RNP",
- "IRS-L DRIFT",
- "IRS-R DRIFT",
- "IRS POS/ORIGIN DISAGREE",
- "VERIFY POS: IRS-FMC",
- "VERIFY POS: IRS-IRS".

Operating Instructions

The following procedure is recommended for B737NG airplanes with at least one HG2050BC02 ADIRU installed.

During the Preliminary Preflight Procedure perform a full IRS alignment for one or more of the following:

- On the first flight of the day
- If continuous AC electrical power is not available to the airplane during ground stops
- If 18 hours have elapsed since the last full alignment
- If before the start of a flight, 18 hours will be exceeded since the last full alignment, during the course of the next flight leg.

After alignment is complete, remain in NAV mode as long as possible.

A Fast Realignment, as described in the FCOM SP.11, Supplementary Procedures, may be performed between successive flight legs. This will reset the accumulated position and groundspeed error from the previous flight.

1. Boeing recommends checking the residual ground speed error at the end of each flight and within five (5) minutes of reaching the final parking position. The serviceable limits are:
   a. If operating two consecutive flights: less than fifteen (15) knots at the end of each flight.
   b. If operating a single flight: less than twenty one (21) knots at the end of the flight.
2. This is done by taking the following steps:
   - On the CDU select POS REF page 2/3
   - Note the residual groundspeed on IRS L and IRS R
3. If the residual ground speed error of either IRS is in excess of the serviceable limits in 1 a) and b), record in the appropriate Maintenance Document for maintenance action.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-107 as "In Effect" (IE).

Boeing and Honeywell are in the process of finalizing the solution for ADIRU P/N HG2050BC02. When the solution is determined, a Service Bulletin will be issued on the fix to correct this anomaly for ADIRU P/N HG2050BC02.

This FCOM Bulletin will be revised to include Service Bulletin information when available.

This FCOM Bulletin will be cancelled after Boeing is advised that all airplanes in your fleet have been modified, per the subject Service Bulletin.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Intentionally
Blank

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-108

IssueDate: April 20, 2018

Airplane Effectivity: B737-600/700/800/900/BBJ Airplanes with Rockwell Collins FCC Software Version P8.0 or P9.0 installed

Subject: Descent Below Glide Slope During Approach on 737NG Airplanes With Rockwell Collins Flight Control Computer (FCC) software Version P8.0 or P9.0 Installed

Reason: This bulletin informs flight crews operating 737NG airplanes equipped with Rockwell Collins FCC software P8.0 or P9.0 of the potential to descend below the glideslope during approach.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports from 737NG operators that when conducting an ILS approach with the autopilot engaged, APP mode selected on the MCP, and G/S annunciated in green on the Flight Mode Annunciation (FMA), the autopilot did not properly acquire the glideslope. As the airplane descended away from the glideslope centerline the Flight Director (F/D) indicated close to the centered position and the glideslope pointer indicated the airplane below glideslope on the deviation scale.

These events occurred with the autopilot engaged while capturing the glideslope from above with high descent rates (approximately greater than 2000 feet per minute) and late arming of the APP mode. The high descent rate is maintained by the autopilot and can result in the airplane descending below the glideslope requiring flight crew intervention to return to the glideslope centerline.

Boeing has determined that the condition was introduced in FCC software versions P8.0 and P9.0 when a change was incorporated to reduce aggressive pitch-up maneuvers at glideslope capture. The result of the design change is that, following a high descent rate capture, the autopilot may not provide sufficient pitch-up command to reduce the descent rate and acquire the glideslope.

The described descents below glideslope can occur when all of the following conditions are met:

- Glideslope capture above approximately 2500 feet AGL.
- Glideslope capture from above with a descent rate in excess of approximately 2000 fpm.
- Arming the APP mode late, i.e., arming when descending through the glideslope centerline.
- Autopilot engaged (glideslope captures using F/D only are not affected)

It is important to note that even though the reported events occurred during an ILS approach, this anomaly can also occur during a GLS approach or when conducting an instrument approach using IAN.

This anomaly affects 737NG airplanes with the following FCC Operational Program Software (OPS):

P8.0 FCC OPS (227A-COL-AC1-09)

- Boeing Part Number S241A100-509
- Rockwell Collins Part Number 831-5854-180

P9.0 FCC OPS (2272-COL-AC1-10)

- Boeing Part Number S241A100-510
- Rockwell Collins Part Number 831-5854-190

Operating Instructions

Normally the glideslope is captured from below while in level flight. In the event the glideslope needs to be captured from above with the autopilot engaged, use the following recommended techniques and considerations as paraphrased from the Flight Crew Training Manual (FCTM):

- attempt to capture the glideslope prior to the Final Approach Fix (FAF)
- verify the localizer is captured before descending below the cleared altitude or the FAF altitude
- select APP on the MCP and verify that the glideslope is armed
- establish final landing configuration and set the MCP altitude no lower than 1,000 feet AFE
- select the V/S mode and set -1000 to -1500 fpm to achieve glideslope capture and be stabilized for the approach by 1,000 feet AFE. Use of the VSD (as installed) or the green altitude range arc may assist in establishing the correct rate of descent.

- monitor rate of descent and airspeed
- verify correct Flight Mode Annunciations and monitor glideslope deviations.

Note: If the glideslope is not captured or the approach is not stabilized by 1,000 feet AFE, initiate a go-around.

For complete recommended techniques and considerations refer to “Intercepting Glide Slope from Above” in the FCTM found in Chapter 5.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-108 as "In Effect" (IE).

This anomaly will be corrected with the following FCC OPS update which is expected to be available in 3Q2018:

P11.1 FCC OPS (2270-COL-AC2-22)

- Boeing Part Number S241A100-521
- Rockwell Collins Part Number 831-5854-211

This FCOM Bulletin will be canceled after Boeing is notified that all of the affected airplanes in your fleet have been retrofitted with FCC OPS P11.1 or newer.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-109

IssueDate: April 23, 2018

Subject: 737 NG Approach Data Block Anomaly with GLS Channel Selected

Reason: To inform the crew of the potential for missing approach data block information when a GLS channel is selected, and prior to the IMMR receiving ground station data.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Certification flight tests of the Honeywell Integrated Multi-Mode Receiver (IMMR) revealed an anomaly with the presentation of the GLS channel number on the approach data block on the PFD. The GLS channel number can be temporarily shown but subsequently removed.

This anomaly occurs when both of the following conditions are met:

- A GLS channel is tuned and the Ground Based Augmentation System (GBAS) VHF signals are received by the IMMR.
- A new GLS channel corresponding to a different GBAS is tuned and the VHF signals are not yet received by the IMMR.

In addition to the channel number being removed, GLS deviation scales as well as all of the other information on the approach data block can also be removed, including:

- Selected GLS identifier / Selected course
- Runway ID and distance to threshold
- Navigation source reference

Proper GLS approach data block information and GLS deviation scales are restored when the IMMR receives VHF signals from the tuned GBAS.

Honeywell is currently working on a software fix. Once the software fix has been determined, Boeing will communicate appropriate fix instructions.

This anomaly affects 737NG airplanes equipped with:

- Honeywell IMMR Part Number 69002600-0101 and
- Honeywell software 34 MMR OPS P/N HNR55-2601-0501 or
- Honeywell software 34 MMR OPS P/N HNR56-2601-0601.

Operating Instructions

Do not select a GLS channel until completing the Descent Procedure. If after selecting a GLS channel the approach reference and deviation scales are removed, these indications are restored automatically when the airplane is within range of the newly tuned ground station.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-109 as "In Effect" (IE).

The approach data block anomaly is temporary until a fix is implemented. This OMB will be canceled when an operator reports the fix has been installed on all affected airplanes in their fleet.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-110

IssueDate: November 19, 2018

Airplane Effectivity: B737-600/700/800/900/BBJ Airplanes with FMC Software U11/U12/U13 installed

Subject: Lateral Path Exceedance On Approach Procedures With A Course Reversal

Reason: This bulletin informs flight crews of an FMC software U11, U12 and U13 anomaly which generates an LNAV lateral path exceedance when flying an approach with a course reversal to the inbound leg.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing and GE have received reports from operators of FMC generated LNAV lateral path exceedances when flying an approach with a course reversal to the inbound leg. Some of these approach procedures commence the course reversal at a specified DME and have a lateral limitation not to exceed XX.X DME. In certain instances, the FMC created path may result in exceeding the DME restriction.

This condition was introduced in FMC U11 when a design change was made to prevent bypasses or discontinuities, based on procedure design of large track changes that are not flyable with high terminal ground speeds.

Operating Instructions

When executing approaches containing distance constrained course reversals on airplanes with FMC Software U11, U12 and U13, crews should be aware of this anomaly and pay particular attention that the lateral path on the Navigation Display (ND) does not exceed the limits indicated on the approach procedure. This can be done by reviewing the procedure as displayed on the ND.

To mitigate this issue, it may be necessary to complete the course reversal using Heading Select (HDG SEL) to avoid a lateral path exceedance.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-110 as "In Effect" (IE).

This anomaly will be corrected in FMC Software update U14.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-111 R1

IssueDate: September 19, 2019

Subject: All Six Display Units Blanking With CDS BP15 and FMC U12 or Newer Installed

Reason: To make flight crews aware that all six Display Units (DUs) can blank if a runway with a 270 degree true heading is selected on the FMC ARRIVALS page.

This bulletin is being revised to include affected runways 4500 ft or greater in length and 75 ft or greater in width, to update HUD information, and to provide Service Bulletin information.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

An operator recently experienced blanking of all six DUs with a selected instrument approach to a runway with a 270 degree true heading, RWY 25 at PABR. All six DUs stayed blank until a different runway was selected on the FMC ARRIVALS page.

Boeing and Honeywell have determined that all six DUs can blank if certain runways with a 270 degree true heading are selected on the FMC ARRIVALS page and one of the conditions below is met (whichever occurs first):

- the airplane is more than 400 NM from the origin airport
- the airplane is more than half way between the origin and destination airports
- the airplane is within two minutes of the Top of Descent (T/D).

This applies only to airplanes with CDS BP15 and FMC U12 or newer installed. It is important to note that only certain runways with a true heading of 270 degrees selected in the FMC can be affected. The actual landing runway has no effect on displays. Standby instruments are not affected. The HUD (if installed) is available, but the digital barometric altitude on the HUD is referenced to 29.92 and cannot be changed.

Boeing and Honeywell are reviewing worldwide airports with a runway 4500 ft or greater in length and 75 ft or greater in width. At this point, the following runways at the airports listed below are known to be affected:

- 82V RW26 (Pine Bluffs, Wyoming, USA)
- KBJJ RW28 (Wayne County, Ohio, USA)
- KCIU RW28 (Chippewa County, Michigan, USA)
- KCNM RW26 (Cavern City, New Mexico, USA)
- PABR RW25 (Barrow, Alaska, USA)
- SKLM RW28 (La Mina, La Guajira, Colombia)
- SYCJ RW29 (Cheddi Jagan, Georgetown, Guyana)

As Honeywell continues to develop a software solution and to process data, operators are encouraged to report any DU blanking issues to Honeywell and Boeing in order to provide the most effective solution possible to this anomaly.

Operating Instructions

With CDS BP15 and FMC U12 or newer, do not select a runway listed above in the FMC.

If all six DUs blank, select a different runway on the FMC ARRIVALS page. The newly selected runway must have a different runway heading.

Administrative Information

This bulletin replaces bulletin TBC-111. Revise the Flight Crew Operations Manual Bulletin Record Page to show bulletin TBC-111 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-111 R1 as "In Effect" (IE).

Retrofit information will be provided by Service Bulletin SB 737-31A1880, currently scheduled for release in 4Q2019. This bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been retrofitted with CDS BP 15A software. Please report to Boeing the Line Number, Serial Number, or Tabulation Number of all airplanes for which the above has been confirmed.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-114

IssueDate: March 22, 2021

Airplane Effectivity: 737-600/-700/-800/-900 Airplanes with Honeywell IMMR Hardware Part Number 69002600-0101.

Subject: Dual loss of GPS for airplanes equipped with Honeywell Integrated Multi-Mode Receiver (IMMR) 69002600-0101 in combination with specific IMMR software installed

Reason: To provide information to flight crews about possible loss of both GPS signals and the related effects.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

There have been reports of a loss of both GPS signals, both on the ground and in flight, on airplanes equipped with Honeywell IMMR. The loss of both GPS signals can last for a couple of minutes to as long as several hours and there is no maintenance or flight crew action that can restore GPS signals. Re-acquisition of valid GPS signals occurs automatically without any flight crew action.

Honeywell has identified the problem to be improper indexing of Global Navigation Satellite System (GLONASS) signals and when all of the following occurs:

- GLONASS satellite COSMOS 2417 (SN 26) is visible
- GPS satellite NAVSTAR 66 (PRN 01) is not visible
- GPS receiver enters acquisition mode.

  Note: The IMMR enters GPS acquisition mode during power up, there are insufficient satellites in view, there is interference, or the GPS receiver enters a self-test.

When the above occurs, the GPS receivers cannot process signals until GLONASS COSMOS 2471 (SN 26) is no longer visible or GPS satellite NAVSTAR 66 (PRN 01) is visible. This can last for a couple of minutes to as long as several hours and there is no maintenance or flight crew action that can restore GPS signals. Re-acquisition of valid GPS signals occurs automatically without any flight crew action.

When a loss of both GPS signals occurs, the following flight deck effects can occur:

- GPS-L INVALID and GPS-R INVALID FMC scratch pad message
- UNABLE REQD NAV PERF-RNP FMC scratch pad and Navigation Display (ND) messages
- VERIFY POS FMC scratch pad message
- TERR POS Navigation Display (ND) message
- TERR FAIL Navigation Display (ND) message
- FMC P/RST lights on the forward panel
- GPS and GLS lights on the aft overhead panel
- GPWS and RUNWAY INOP lights on the right forward panel
- ATC FAIL light on transponder panel due to loss of ADS-B OUT
- Navigation Performance Scales (NPS) indications turn amber as a result of decrease in FMC navigation accuracy.

When a loss of both GPS signals occurs, operational impacts include:

- Inability to conduct operations that **require the use of GPS** including SIDs, enroute operations, STARS, and instrument approaches
- Inability to conduct operations that require ADS-B OUT.

A software fix has been released via Service Bulletin 737-34-3685.

This anomaly affects 737-600/-700/-800/-900 airplanes equipped with:

- Honeywell IMMR Hardware Part Number 69002600-0101 and one of the following Honeywell Software Part Numbers:
  - HNR55-2601-0501,
  - HNR56-2601-0601, or
  - HNR58-2601-0801.

Operating Instructions

If the loss of both GPS signals occurs:

On the ground:

Do not takeoff.

In Flight

Only ground based navigation aids such as VOR, DME, ADF and ILS are available.

Look ahead terrain alerts; TERRAIN TERRAIN PULL UP, CAUTION TERRAIN and TOO LOW TERRAIN are not available.

Note: GPWS alerts are based on radio altitude, barometric altitude, airspeed, glideslope deviation and airplane configuration. These alerts remain valid, and if they occur, do the respective maneuver.

Verify DME UPDATE is ON.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-114 as "In Effect" (IE).

This FCOM Bulletin will be canceled when an operator reports Service Bulletin completion on all affected airplanes in their fleet.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Intentionally
Blank

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-115

IssueDate: April 28, 2021

Airplane Effectivity: All 737-600/700/800/900/BBJ (Fail Operational) with Rockwell Collins FCC 9.0 or 11.1 or Newer

Subject: Localizer Overshoot When Using LNAV to Intercept the Localizer for Fail Operational Airplanes with Rockwell Collins FCC 9.0 or 11.1 or Newer

Reason: This bulletin informs flight crews of affected 737-600/700/800/900/BBJ (Fail Operational) airplanes with Rockwell Collins FCC 9.0 or 11.1 or newer of the potential for localizer overshoot by the Autopilot Flight Director System (AFDS) when using LNAV to intercept the localizer.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports from operators of the affected 737-600/700/800/900/BBJ (Fail Operational) airplanes with Rockwell Collins FCC 9.0 or 11.1 or newer that the AFDS did not provide proper guidance when capturing a localizer from certain transitions flown in the LNAV roll mode. These incidents have occurred on transitions with large intercept angles (60 degrees or more) and have resulted in flight through the localizer path (overshoot) during capture.

Flight data have confirmed that during these overshoot events, the AFDS initially banks up to 30 degrees but then reduces bank angle during localizer capture and continues through the final approach course, even when VOR/LOC is the engaged roll mode as shown by the Flight Mode Annunciation (FMA). AFDS correction back to the localizer course may not occur within the distance available to establish a stabilized final approach.

Most overshoot events have been reported on ILS approaches with transition segments which intercept the localizer at 90-degree angles. However, some overshoots have also occurred with intercept angles less than 90 degrees. In these events, LNAV is the engaged roll mode prior to engagement of VOR/LOC during localizer capture.

In all reported overshoot events, deviation from the localizer was accurately shown by the localizer pointer and scale on the primary flight display (PFD) and the navigation display (ND), and by the airplane symbol on the ND.

Boeing has been able to reproduce the overshoot behavior in an engineering simulator and has determined the root cause. Boeing plans to correct the undesired localizer capture behavior in future Rockwell Collins FCC Operational Program Software (OPS).

Operating Instructions

When conducting an approach using LNAV to intercept a localizer-based final approach course, monitor localizer raw data and call out deviations. If an overshoot occurs that exceeds or is likely to exceed stabilized approach criteria, go around.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record Page to show bulletin TBC-115 "In Effect" (IE).

This undesired localizer capture behavior will be corrected with a future Rockwell Collins FCC OPS.

This FCOM Bulletin will be canceled after Boeing is notified that all of the affected airplanes in your fleet have been retrofitted with the appropriate Rockwell Collins FCC OPS when available.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to the 737 Manager, Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-117 R3

IssueDate: June 30, 2023

Airplane Effectivity: 737-600 /-700/-700C /-800 /-900/-900ER

Subject: Radio Altimeter Anomalies Due to 5G C-Band Wireless Broadband Interference in the United States

Reason: Radio altimeters can be unreliable due to interference from 5G C-Band wireless broadband.

This bulletin is being revised to reflect the latest information released by the FAA on 5G C-Band interference.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Frequency spectrum, power levels, tower location, and antenna direction used by new 5G C-Band wireless broadband technology in the United States can interfere with radio altimeters, especially at lower altitudes. Radio altimeters can fail or present erroneous information, which affects systems using radio altimeter data.

In response to this, the FAA has issued Airworthiness Directives (AD 2023-10-02 and AD 2023-12-13) that prohibit certain operations requiring radio altimeter (RA) data when in the presence of 5G C-Band interference.

Background Information (continued)

The FAA considers these ADs to be an interim action. Once the Technical Standard Order (TSO) standard for radio altimeters is established, which will follow the existing international technical consensus on the establishment of the minimum operational performance standards (MOPS), the FAA anticipates that the MOPS will be incorporated into the TSO. Once a new radio altimeter TSO is developed, approved, and available, the FAA might consider additional rulemaking.

In the interim, an airplane that has equipment installed that meets the tolerances specified in the applicable AD is considered a radio altimeter tolerant airplane. Aircraft unable to meet these tolerances are considered non-radio altimeter tolerant airplanes.

AD 2023-12-13 establishes the new concept of 5G C-Band Mitigated Airports (CMAs). CMAs are airports at which 5G providers have voluntarily agreed to limit 5G C-Band interference through limiting power levels and tower locations. They will be identified through an FAA Domestic Notice, and all 5G NOTAMs and current Alternative Methods of Compliance (AMOCs) will be discontinued as of June 30, 2023. The AD 2023-12-13 requires operational restrictions for radio altimeter tolerant airplanes at non-CMAs and for non-radio altimeter tolerant airplanes at all airports in the contiguous U.S. due to the potential presence of 5G C-Band wireless broadband interference.

The FAA AD 2023-10-02 identifies several types of operations that are prohibited when operating a non-radio altimeter tolerant airplane in the contiguous U.S. airspace:

- Instrument Landing System (ILS) Instrument Approach Procedures (IAP) SA CAT I, SA CAT II, CAT II, and CAT III
- Automatic Landing Operations
- Manual Flight Control Guidance System operations to landing/head-up display (HUD) to touchdown operation
- Use of Enhanced Flight Vision System (EFVS) to touchdown under 14 CFR Part 91.176(a).

The reference to the Manual Flight Control Guidance System in the 3rd bullet above, refers to a HUD mode that provides guidance to touchdown.

5G Interference and Potential Effects on Radio Altimeter Indications

When a radio altimeter is subjected to 5G interference, there are three different possible effects for each radio altimeter:

- Fail Warning: Failure of the radio altimeter results in failure alerts of radio altimeter including flags and other system alerts
- No Computed Data (NCD): No data is generated by the radio altimeter. The data shown on the Primary Flight Display (PFD) and HUD (as installed) will be removed from view, however this condition does not generate an alert since it is a normal condition of the radio altimeter
- Erroneous: Interference causes erroneous data to be sent to airplane systems. The erroneous radio altimeter data in this case will be shown on the PFD and HUD (as installed), however, it can be erroneously high or low.

Background Information (continued)

5G Interference and Potential Effects on Airplane Systems

Flight deck effects may be variable on the 737 and multiple systems can be impacted regardless of the approach type or weather. They include, but are not limited to the following:

Autopilot Flight Director System

- NO AUTOLAND autopilot status annunciation may be shown on the PFD and the HUD (as installed - fail operational autopilot and HUD)
- NO AUTOLAND advisory message may be shown on the engine display (as installed - fail operational autopilot)
- Autopilot disengagement may occur during ILS/GLS approaches (as installed - GLS approach capability)
- Autopilot may not engage
- Flare mode (as installed - fail-passive/fail-operational autopilot) and runway alignment (as installed - fail-operational autopilot) may not be available or may activate earlier or later than expected (ILS; as installed - GLS, IAN)
- Flight director on the PFD and HUD may retract from view during ILS/GLS/IAN approach (as installed - HUD and GLS, IAN approach capability)
- Flight director guidance on the PFD and HUD may be erroneous (as installed - HUD)
- LNAV and VNAV may not engage or engage at an erroneous altitude after departure (as installed)
- Takeoff or Go-Around (TO/GA) mode may not be available.

Autothrottle System

- Autothrottle (A/T) may not be available
- A/T may remain in MCP SPD mode and may advance to maintain speed during flare instead of reducing the thrust to RETARD at 27 feet RA, or may reduce thrust to RETARD prematurely.

Flight Controls

- Automatic speedbrake deployment may not occur after touchdown
- SPEEDBRAKES EXTENDED amber light may not illuminate or may illuminate erroneously
- SPEEDBRAKE time critical visual and aural warnings may not be available (as installed)

5G Interference and Potential Effects on Airplane Systems (continued)

Flight Instruments

- The RA indication on the PFD and HUD may not show or may be erroneous (as installed - HUD)
- The RADIO minimums indications (flashing or turning amber) may not be available or may be erroneous on the PFD and HUD (as installed - HUD)
- Rising runway symbol may not show on the PFD (as installed)
- The localizer/FAC deviation alert (amber scale on the PFD and flashing pointer on the PFD and HUD) may not show (the deviation indications are still available) (as installed - HUD and IAN)
- The glideslope/glidepath deviation alert (amber scale on the PFD and flashing pointer on the PFD and HUD) may not show (the deviation indications are still available) (as installed - HUD and IAN).

Traffic Alert and Collision Avoidance System (TCAS)

- TCAS alerts may not be available (TCAS alerts that do occur will be valid)
- TCAS inhibits for resolution advisories may be erroneous.

Ground Proximity Warning System (GPWS)

- GPWS alerts may not be available or may be erroneous. Look-Ahead Terrain Alerting remains available
- In-Air Overrun, On-Ground Overrun and SPEEDBRAKE warnings may not be available or may be erroneous (as installed)
- Radio altitude-based altitude and minimums aural callouts during approach may not be available or erroneous
- Windshear detection systems (predictive and reactive) may be inoperative.

Configuration Warnings

- Erroneous illumination of the red landing gear indicator lights may occur
- Erroneous steady landing gear warning horn may occur
- Radio Altitude Based Alerts may not be available or may be erroneous.

Warning Systems

- Stall warning test may not be available.

Considerations for Dispatch

- No impacts on takeoff distance
- No impacts to dispatch landing performance calculations
- Adjust operational (time of arrival) landing distance for manual speedbrakes

The instrument approach and autoland prohibitions of 5G interference ADs may impact the destination and alternate weather requirements.

Operating Instructions

When operating in the contiguous U.S. airspace, the flight crews should be alert for system anomalies that have been described above.

For non-radio altimeter tolerant airplanes, comply with the following instructions at airports in the contiguous U.S.

For radio altimeter tolerant airplanes, comply with these instructions at non-CMAs in the contiguous U.S., unless covered by an Alternative Method of Compliance (AMOC).

Monitoring and cross checking of barometric and radio altitude indications can provide early indications of 5G interference. If the autopilot flight director system (AFDS) and autothrottle are not performing as expected, pilots should be prepared to disengage both the autopilot and autothrottle, turn off both flight directors, apply manual inputs to ensure proper control of path and performance, and follow the guidance below for the appropriate phase of flight.

Radio altimeter anomalies may not be evident until very low altitudes. After touchdown, the flight crew should be aware of speedbrake deployment. Landing distances can be longer than normal due to the effect of interference on automatic speedbrake deployment.

Prior to Takeoff

Verify normal radio altimeter indications.

Climb Out

- TO/GA mode may not be available
- Monitor pitch mode engagement.
- Monitor roll mode engagement
- Autopilot may not engage.

Descent

Plan on doing a time of arrival (en route) landing distance assessment using normal landing performance adjusted for manual speedbrake deployment.

Operating Instructions (continued)

During ILS, GLS or IAN Approaches

- Monitor radio altimeters for anomalies
- Monitor performance of the AFDS and autothrottle
- If any of the following occurs, disengage the autopilot and autothrottle, and turn off both flight directors:
  - The flight directors automatically retract from view
  - The FLARE pitch mode engages
  - The autothrottle retards to idle
  - Other suspected 5G interference.

Note: If the runway environment is in sight and in a position to make a safe landing, continue manually to a landing.

Note: If the runway environment is not in sight or not in a position to make a safe landing, manually do a go-around and missed approach procedure, and do not engage the autopilot or autothrottle or turn on either flight director until reaching a safe altitude.

At DA(H), MDA(H), or the missed approach point:

- If the runway environment is in sight and in a position to make a safe landing, do the following and continue for a normal manual landing:
  - Disengage the autopilot
  - Disengage the autothrottle
  - Turn off both flight directors.
- If a go-around is needed, do the go-around and the missed approach procedure either in manual or automatic flight:
  - If the AFDS and autothrottle are not performing as expected, pilots should be prepared to disengage both the autopilot and autothrottle, turn off both flight directors, apply manual inputs to ensure proper control of path and performance.

Operating Instructions (continued)

During Landing

- Radio altitude-based altitude aural callouts during approach may be not available or erroneous
- Manual deployment of the speedbrakes may be needed.

During Go-Around and Missed Approach

- TO/GA mode may not be available
- Monitor thrust and verify that thrust increases to go-around thrust
- Monitor pitch mode engagement, as needed
- Monitor roll mode engagement, as needed.

When at a safe altitude:

- Turn on flight directors and verify pitch and roll modes, as needed
- Engage autopilot, as needed
- Engage autothrottle, as needed.

If Radio Altimeter Anomalies are Experienced

Operators and pilots who experience radio altimeter anomalies should notify air traffic control, as soon as practical. Post flight, follow established procedures or policies to document the radio altimeter anomaly so that the radio altimeters can be checked for proper operation. Pilots are encouraged to submit detailed reports of radio altimeter disruptions or interference events, as soon as practical, using the *Radio Altimeter Anomaly Reporting Form* available on the FAA website at https://www.faa.gov/air_traffic/nas/RADALT_reports/.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-119

IssueDate: November 9, 2022

Airplane Effectivity: B737-600/-700/-700C/-800/-900/-900ER with FMC U14 or U14.1

Subject: DATALINK FULL Datalink Status Message

Reason: To inform flight crews of a process to clear the DATALINK FULL message and reset the ability to send out datalink messages.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has been made aware of a datalink fault on airplanes with Flight Management Computer (FMC) U14 or U14.1. If a datalink download is interrupted, any datalink downloads that follow will not be transmitted. This results in a backlog of datalink messages in the download queue which will eventually result in a DATALINK FULL Control Display Unit (CDU) datalink status message.

This anomaly will be corrected with the installation of FMC U14.2 which is scheduled to be released in 4Q2023.

Operating Instructions

If a DATALINK FULL CDU datalink status message occurs, when workload permits do the following:

FMC source select switch ....BOTH ON R

Wait at least 30 seconds

FMC source select switch ....NORMAL

Datalink messages in the download queue will begin to download automatically as well as any new datalink messages. Repeat steps above as needed.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-119 as "In Effect" (IE).

This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have installed FMC U14.2.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-120

IssueDate: November 11, 2022

Airplane Effectivity: B737-600/-700/-700C/-800/-900/-900ER

Subject: Dual FMC Resets During CPDLC On Airplanes Equipped With FMC U14 or U14.1, and FANS 1 or FANS 2

Reason: To inform flight crews of a possible dual FMC reset anomaly.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received several reports from operators regarding dual Flight Management Computer (FMC) resets during Controller Pilot Data Link Communications (CPDLC). The dual FMC resets can occur after the airplane responds to a CPDLC uplink message by either selecting ACCEPT, REJECT or STANDBY. Review of provided datalink audits show situations where ATC sends an error uplink in response to the airplane sending a downlink response. The ATC error uplink contains a Message Reference Number (MRN) that is the same as the airplane’s downlink MRN. The error uplink can reach the airplane before the airplane receives the ATC Logical Acknowledgment, or Network Acknowledgment in FANS airspace. When this occurs, the downlink response message becomes corrupted which results in a dual FMC reset.

These dual FMC resets have occurred on airplanes equipped with FMC U14 and Future Air Navigation System (FANS) 2, but testing has shown that the dual FMC resets can also occur with FMC U14.1 and FANS 1. As a result, any combination of FMC U14 or U14.1 and FANS 1 or FANS 2 is susceptible to this dual FMC reset anomaly.

Operating Instructions

If a dual FMC reset occurs within 1 minute of a response to a CPDLC uplink, wait 1 minute to allow the FMCs to reset. Once the FMCs have reset, an active waypoint may need to be selected and a CPDLC connection may need to be reestablished.

To prevent the FMC reset from reoccurring, do not:

- Select the error uplink in the ATC LOG page
- Select the original uplink that generated the downlink response in the ATC LOG page (message status will show OPEN).

Note: Selection of the ATC function key on the Multi-purpose Control Display Unit (MCDU) can sometimes cause the dual FMC reset to occur.

During a dual FMC reset, the flight crew can do the FMC FAIL Non-Normal Checklist (NNC) if in the flight crew’s judgment that is the best course of action. The steps in the FMC FAIL NNC will not prevent the FMCs from self resetting per the anomaly described in this bulletin.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-120 as "In Effect" (IE).

This anomaly will be corrected with the installation of FMC U14.2 which is scheduled to be released 4Q2023.

This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have be retrofitted with FMC U14.2 or newer.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-121

IssueDate: April 15, 2023

Airplane Effectivity: All Airplanes

Subject: Flap Lever Operation

Reason: This bulletin provides information on flap lever operation.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received reports of unintentional flap movement, including flap and slat extension in cruise, due to the flap lever migrating aft after partial/incomplete seating in the intended detent. Investigation revealed that airplane vibration or unintentional flight crew contact with the flap lever in this partially seated condition may have contributed to the aftward movement of the flap lever.

The flap control system is cable-driven. The flap lever is connected to cables that rotate a cable quadrant to open the associated control valve. The cables are rigged with a tension “preload” that pulls the flap lever in the aft direction when in the UP position. This ensures that the cable control system holds the quadrant firmly in place when the flap handle is stowed in the UP detent to prevent unintended flap actuation. The tension preload can vary between airplanes due to allowable tolerances in the cable rigging process and the normal stretching of the cables over time.

The flap lever mechanism has a detent at each selectable flap position. A pin attached to the flap lever prevents uncommanded flap lever movement while in the selected detent. The lever must be raised out of the detent to select a different position. Due to variation in the tension preload, some airplanes can require additional forward and downward force to place the lever into the detent in the UP position.

Operating Instructions

When moving the flap lever to the commanded position, push down firmly and visually confirm that the flap lever is in the selected detent.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-121 as "In Effect" (IE).

Boeing is updating the flap rigging document and AMM procedures to ensure more uniform flap lever operation. The information in this bulletin will be incorporated in a future revision of the FCOM.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

Number: TBC-122

IssueDate: October 17, 2023

Airplane Effectivity: B737-600/-700/-700C/-800/-900/-900ER with FMC U14

Subject: Dual FMC Resets After a Conditional Waypoint (VECTOR)

Reason: To inform flight crews of a possible dual FMC reset anomaly.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing has received operator reports of dual Flight Management Computer (FMC) resets when flying a route that includes a conditional waypoint leg (VECTOR), followed by a route discontinuity (ROUTE DISCONTINUITY), followed by a waypoint with an RNP value. This route sequence can occur when a procedure such as a STAR or SID terminates in a heading or track during which radar vectors are expected. In such a case, after the conditional waypoint (VECTOR), a route discontinuity appears before subsequent waypoints. If the first waypoint after the discontinuity has an associated RNP value, a software exception can occur when (VECTOR) becomes the active waypoint.

When the described software exception occurs, the MCDUs first show the scratchpad message VNAV INVALID - PERF, then the MCDUs blank. After the FMCs reset, the (VECTOR) leg does not appear. However, the remaining flight plan route is retained and is shown after a ROUTE DISCONTINUITY in RTE LEGS. The crew is prompted to select and execute an active waypoint, and must reenter the cost index (CI) to recover VNAV.

Dual FMC resets for this software exception have occurred in FMC U14-equipped airplanes. Exception handling logic is corrected for this anomaly in FMC U14.1.

Operating Instructions

The software exception described occurs when:

- (VECTOR) is active
- followed by ROUTE DISCONTINUITY
- followed by a waypoint with RNP

Removing one of the above conditions before the conditional waypoint (VECTOR) is active can prevent the exception and dual FMC reset. This can be done by deleting the (VECTOR) leg or by closing the discontinuity after obtaining an ATC radar vector heading or alternate clearance. It can be difficult to determine whether a waypoint is coded with an RNP value as that will depend on the selected procedure, transition, or route of flight; however, when a waypoint with no coded RNP value follows the discontinuity, the software exception will not occur.

When a dual FMC reset occurs as a result of the anomaly described, the FMCs should recover after a short time. Boeing recommends that the flight crew do the FMC FAIL Non-Normal Checklist (NNC) and prepare to resume conventional navigation. The steps in the FMC FAIL NNC will not prevent the FMCs from self-reset.

After the FMCs have reset, it is necessary to select an appropriate waypoint and to enter the Cost Index to restore VNAV.

Administrative Information

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-122 as "In Effect" (IE).

This anomaly will be corrected with the installation of FMC U14.1, available now, or U14.2 which is scheduled to be released 4Q2024. This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been retrofitted with FMC U14.1 or newer.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Flight Crew Operations Manual Bulletin
for
The Boeing Company

The Boeing Company
Seattle, Washington 98124-2207

737

Number: TBC-123 R1

IssueDate: December 20, 2023

Airplane Effectivity: B737-600/-700/-700C/-800/-900/-900ER

Subject: Unexpected Roll Command during RNP approaches with a RNP of 0.3 or below

Reason: This bulletin informs flight crews of an unexpected roll during RNP approaches with a RNP of 0.3 or below.

This bulletin is being revised to update the Background Information, Operating Instructions, and Administrative Information sections.

Information in this bulletin is recommended by The Boeing Company, but may not be FAA approved at the time of writing. In the event of conflict with the FAA approved Airplane Flight Manual (AFM), the AFM shall supersede. The Boeing Company regards the information or procedures described herein as having a direct or indirect bearing on the safe operation of this model airplane.

THE FOLLOWING PROCEDURE AND/OR INFORMATION IS EFFECTIVE UPON RECEIPT

Background Information

Boeing and GE Aviation have received in-service reports of unexpected roll commands and resulting lateral path deviation from the centerline during RNAV/RNP approaches. These events can occur when the FMC enters the approach environment requiring RNP values of RNP 0.3 or below with the Autopilot "B" engaged in Command. The steering gains are increased when transitioning to a RNP environment of RNP 0.3 or below.

Dual FMC system design requirements make the left FMC primary when the FMC source select switch is set to either "Both on Left" or "Normal". Each Autopilot uses the onside FMC, meaning Autopilot "A" uses FMC-L for primary guidance while Autopilot "B" uses FMC-R. In these reported events, Autopilot "B" is selected and the FMC Source Select Switch is in the "Normal" position.

The condition appears to have been introduced with FMC software update U11, where a gain increase was added to the FMC Roll Command control law when the FMC enters the approach environment requiring RNP values of RNP 0.3 or below. When the gain increases, the left FMC may contain a residual crosstrack error that is not present in the right FMC. Due to the increase in command gain, the residual FMC roll command also increases and the left and right FMC command may differ by more than 5.5 degrees, which is the tolerance. When the tolerance is exceeded, it results in a RAM Crossload to resynchronize the two FMCs and triggers the right FMC to increase its roll command output from FMC-R and subsequent FCC "B" commanded roll rate. This generates a temporary roll maneuver that is unexpected.

GE analysis indicates a worst case deviation induced by the left FMC RAM crossload is limited to less than 0.1 NM before the FMC self corrects. The resulting crosstrack error is less than the RNP containment boundary for annunciation of the "UNABLE REQD NAV PERF-RNP" message.

This condition has been reproduced and its root cause has been determined. Boeing currently plans to incorporate the fix for this condition in FMC OPS U14.2.

Operating Instructions

Using Autopilot “A” (CMD A) prevents RAM Crossloads from impacting approach procedures.

Note: Autopilot “B” (CMD B) may be used but flight crews should be aware of the potential for an unexpected roll command if a RAM Crossload occurs.

Administrative Information

This bulletin replaces bulletin TBC-123, dated October 23, 2023. Revise the Flight Crew Operations Manual (FCOM) Bulletin Record Page to show bulletin TBC-123 as “CANCELLED” (CANC).

Insert this bulletin behind the Bulletin Record page in Volume 1 of your Flight Crew Operations Manual (FCOM). Amend the FCOM Bulletin Record page to show bulletin TBC-123 R1 as "In Effect" (IE).

This anomaly will be corrected with the installation of U14.2 which is expected to be released in 2025. This FCOM Bulletin will be canceled after Boeing is notified that all affected airplanes in your fleet have been retrofitted with FMC U14.2 or newer.

Please send all correspondence regarding Flight Crew Operations Manual Bulletin status, to Flight Technical Data, through the Service Requests Application (SR App) on the MyBoeingFleet home page.

Limitations — Chapter L

Table of Contents — Section TOC

General

This chapter contains:

- Airplane Flight Manual (AFM) limitations
- AFM operational information
- Non-AFM operational information.

Limitations and operational information are included if they are:

- operationally significant
- required by FAA Airworthiness Directive
- required by another regulatory requirement.

Limitations and operational information are not included if they are:

- incorporated into FCOM normal, supplementary, or non-normal procedures, with a few exceptions
- shown on a placard, display, or other marking.

Limitations and operational information listed in this chapter that must be memorized (memory items) are marked with a (#) symbol. They meet the following criterion - flight crew access by reference cannot assure timely compliance, e.g., Maximum Takeoff and Landing Tailwind Component. They need only be memorized to the extent that compliance is assured. Knowing the exact wording of the limitation is not required.

Assuming that the remaining items are available to the flight crew by reference, they do not need to be memorized.

[TBC only]

Note: Limitations and operational information referring to airplane options and configuration differences are shown in [brackets]. These items are applicable to the TBC FCOM only, and do not appear in customer FCOMs.

Airplane General

AFM Limitations

Runway slope	+/– 2%
# Maximum Takeoff and Landing Tailwind Component **Note:** The capability of the airplane(s) has been satisfactorily demonstrated for takeoff and manual landing with tailwinds up to 15 knots. **Note:** Airplanes operating under FAA Rules: This finding does not constitute operational approval to conduct takeoffs or landings with tailwind components greater than 10 knots.	[Option - 15 kt tailwind] 15 knots (see note(s)) [Option - 10 kt tailwind] 10 knots
Maximum speeds	Observe gear and flap placards
Maximum Operating Altitude	41,000 feet pressure altitude
Maximum Takeoff and Landing Altitude	[Option - Typical] 8,400 feet pressure altitude [Option - High altitude landing system] 12,000 feet pressure altitude

[Option - Without polar navigation]
Maximum flight operating latitude is dependent on the configuration of the Magnetic Variation tables in the ADIRU as follows: 82° North and 82° South, except for the region between 80° West and 130 ° West longitude, the maximum flight operating latitude is 70° North, and the region between 120° East and 160° East longitude, the maximum flight operating latitude is 60° South.

Installation of handle covers on the overwing exits must be verified prior to departure whenever passengers are carried.
[Option - Flight deck security door]
Verify that an operational check of the flight deck door access system has been accomplished according to approved procedures once each flight day.

AFM Operational Information

Severe Turbulent Air Penetration speed is 280 KIAS / .76M, whichever is lower. Applicable to Climb and Descent only. During Cruise, refer to SP.16, Severe Turbulence Supplementary Procedure.

Non–AFM Operational Information

On revenue flights, the escape slide retention bar (girt bar) must be installed during taxi, takeoff and landing.

Do not operate HF radios during refueling operations.

Altitude Display Limits for RVSM Operations

Standby altimeters do not meet altimeter accuracy requirements of RVSM airspace.

The maximum allowable in-flight difference between Captain and First Officer altitude displays for RVSM operations is 200 feet.

The maximum allowable on-the-ground altitude display differences for RVSM operations are:

Field Elevation	Max Difference Between Captain & F/O	Max Difference Between Captain or F/O & Field Elevation
Sea Level to 5,000 feet	50 feet	75 feet
5,001 to 10,000 feet	60 feet	75 feet

Weight Limitations

AFM Limitations

Note: The maximum weight limitations can be further limited as referenced in the WEIGHT LIMITATIONS section of the CERTIFICATE LIMITATIONS chapter of the AFM.

Note: Possible conflicts between the AFM and the FCOM may occur due to separate publication release dates. In the event of a conflict between the FCOM and the AFM, the AFM shall govern.

Maximum Taxi Weight

[Option - Typical 737-600]

127,500 Pounds / 57,833 Kilograms

[Option - Typical 737-700]

133,500 Pounds / 60,554 Kilograms

[Option - Typical 737-800]

156,000 Pounds / 70,760 Kilograms

[Option - Typical 737-900]

174,700 Pounds / 79,242 Kilograms

Maximum Takeoff Weight

[Option - Typical 737-600]

127,000 Pounds / 57,606 Kilograms

[Option - Typical 737-700]

133,000 Pounds / 60,327 Kilograms

[Option - Typical 737-700 with CFM56-7B26 Thrust]

Note: Minimum Takeoff Weight – 125,000 pounds / 56,699 kilograms. Lower minimum takeoff weights that account for the actual pressure altitude and outside air temperature may be obtained by using the Minimum Takeoff Weight table in the Takeoff section of the Performance Dispatch (PD) chapter.

[Option - Typical 737-800]

155,500 Pounds / 70,533 Kilograms

[Option - Typical 737-900]

174,200 Pounds / 79,015 Kilograms

Maximum Landing Weight

[Option - Typical 737-600]

120,500 Pounds / 54,657 Kilograms

[Option - Typical 737-700]

128,000 Pounds / 58,059 Kilograms

[Option - Typical 737-800]

144,000 Pounds / 65,317 Kilograms

[Option - Typical 737-900]

146,300 Pounds / 66,360 Kilograms

(144,200 Pounds / 65,407 Kilograms)*

* Airplanes operating under FAA Rules: Max Landing Weight (Flaps 15). This maximum weight applies when landing with Flaps 15 under normal conditions. It does not apply when Flaps 15 is required during a Non-Normal Checklist.

Maximum Zero Fuel Weight

[Option - Typical 737-600]

114,000 Pounds / 51,709 Kilograms

[Option - Typical 737-700]

120,500 Pounds / 54,657 Kilograms

[Option - Typical 737-800]

136,000 Pounds / 61,688 Kilograms

[Option - Typical 737-900]

138,300 / 62,731 Kilograms

Air Systems

AFM Limitations

Pressurization

[Option - Normal Cabin Altitude]
The maximum cabin differential pressure (relief valves) is 9.1 psi.
[Option - Reduced Cabin Altitude]
The maximum cabin differential pressure (relief valves) is 9.74 psi.

Non–AFM Operational Information

With either one or both engine bleed air switches ON, do not operate the air conditioning packs in HIGH for takeoff, approach or landing.

Note: The fire protection Non-Normal procedures take precedence over the statement regarding no air conditioning pack in HIGH during takeoff, approach, or landing. The CARGO FIRE and SMOKE/ FUMES REMOVAL checklists require the Operating PACK switch(es) HIGH. Switch(es) need to be placed in HIGH in order to increase ventilation for smoke removal.

Anti–Ice, Rain

[Option - 737-600/-700/-800 without stiffened elevator tabs]
(PRR 38506 or Service Bulletin 737-55A1080)

AFM Limitations

After any ground deicing/anti-icing of the horizontal stabilizer using Type II or Type IV fluids, airspeed must be limited to 270 KIAS until the crew has been informed that applicable maintenance procedures have been accomplished that would allow exceedance of 270 KIAS. Once the applicable maintenance procedures have been accomplished, exceeding 270 KIAS is permissible only until the next application of Type II or Type IV deicing/anti-icing fluids.

Autopilot/Flight Director System

AFM Limitations

Use of aileron trim with the autopilot engaged is prohibited.

Do not engage the autopilot for takeoff below 400 feet AGL.
[Option - FAA rules]
Airplanes operating under FAA Rules:

For single channel operation during approach, the autopilot shall not remain engaged below 50 feet AGL.
[Option - High altitude landing system]
Do not use the autopilot below 100 feet radio altitude at airport pressure altitudes above 8,400 feet.
[Option - Typical, 737-800, EASA rules]
Airplanes operating with EASA Certification: The Minimum Use Height (MUH) for single channel autopilot operation is defined as 158 feet AGL.

[Option - Typical, FAA rules, 15 kt tailwind]

Airplanes operating with FAA Rules: Maximum allowable wind speeds when landing weather minima are predicated on autoland operations:

- Headwind 25 knots
- Crosswind 20 knots
- Crosswind 25 knots.
- Tailwind 15 knots.

[Option - Typical, EASA rules, Cat II or Cat III]

Airplanes operating with EASA Certification – Maximum allowable wind speeds, when conducting a dual channel Cat II or Cat III landing predicated on autoland operations, are:

- Headwind 25 knots
- Crosswind 20 knots

[option - CatIIIb]

- Crosswind 25 knots
- Tailwind 10 knots.
- Tailwind 15 knots.
- Tailwind:

[Option - Typical 737-900, 10 kt tailwind]

Field Elevation	Flaps 30	Flaps 40
2000 feet or less	10 knots	10 knots
2001 to 4000 feet	10 knots	10 knots
4001 to 6000 feet	5 knots	10 knots
Greater than 6000 feet	0 knots	10 knots

[Option - Typical 737-900, 15 kt tailwind]

Field Elevation	Flaps 30	Flaps 40
2000 feet or less	15 knots	15 knots
2001 to 4000 feet	10 knots	15 knots
4001 to 6000 feet	5 knots	15 knots
Greater than 6000 feet	0 knots	15 knots

Maximum and minimum glideslope angles for autoland are 3.25 degrees and 2.5 degrees respectively.

Autoland capability may only be used with flaps 30 or 40 and both engines operative.

[Option - CatIIIb]
Airplanes operating with EASA Certification: Autoland capability may only be used with flaps 30 with one engine operative and only for DH at or above 50 feet.
[Option - CatIIIb]
Airplanes operating under FAA Rules: Autoland capability may only be used with flaps 30 with one engine operative.
[Option - Landing altitudes above 8,400 ft]
Autoland capability may only be used to runways at or below 8,400 ft pressure altitude.
[Option - Integrated Approach Navigation (IAN)]
Do not use Integrated Approach Navigation (IAN) Final Approach Course (FAC) or Glide Path (G/P) guidance under either of the following conditions:

- The flight crew has entered an AT or AT/BELOW altitude constraint for a final approach fix, or for waypoints between a final approach fix and a runway
- Any altitude constraint specified by the approach procedure for a final approach fix, or for waypoints between a final approach fix and a runway, has been modified by the flight crew, after the aircraft has passed the initial approach fix.

Non–AFM Operational Information

Do not use LVL CHG on final approach below 1000 feet AFE.

HUD System
[Option - With HGS and no polar navigation]
Do not use the HUD System at latitudes greater than 85 degrees latitude.
[Option - With HGS 4000 Phase I]
AIII mode approach and landings are not approved for airplanes with Flight Dynamics Model 4000 Phase I HGS installed.

Note: Limitation is not applicable to the Model 4000 HUD system following the incorporation of Phase 4 (or later) software.

Communications

AFM Limitations

[Option - With VHF-3 and ACARS without Voice Mode Protection]
Do not use VHF–3 (if installed for voice communication) for ATC communications with ACARS operational.

Aircraft Communications Addressing and Reporting System

[Option - ACARS]
The ACARS is limited to the transmission and receipt of messages that will not create an unsafe condition if the message is improperly received, such as the following conditions:

- the message or parts of the message are delayed or not received,
- the message is delivered to the wrong recipient, or
- the message content may be frequently corrupted.

However, Pre-Departure Clearance, Digital Automatic Terminal Information Service, Oceanic Clearances, Weight and Balance and Takeoff Data messages can be transmitted and received over ACARS if they are verified per approved operational procedures.

Non–AFM Operational Information

Use the VHF radio connected to the top of fuselage antenna for primary ATC communications on the ground.

Electrical

AFM Limitations

The use of Flight Deck Auxiliary Power outlets in the flight deck requires operational regulatory approval.

Engines and APU

AFM Limitations

Engine Limit Display Markings

Maximum and minimum limits are red.

Caution limits are amber.

Engine Ignition

Engine ignition must be on for:

- takeoff
- landing
- operation in heavy rain
- anti-ice operation.

Thrust

Operation with assumed temperature reduced takeoff thrust is not permitted with anti-skid inoperative.

Reverse Thrust

Intentional selection of reverse thrust in flight is prohibited.

APU

[Option - Typical EASA]
Airplanes operating with EASA Certification: APU bleed + electrical load: max alt 10,000 ft.
[Option - Typical FAA]
Airplanes operating under FAA Rules: Inflight - APU bleed + electrical load: max alt 10,000 ft.
[Option - Typical FAA]
Airplanes operating under FAA Rules: Ground only - APU bleed + electrical load: max alt 15,000 ft.

APU bleed: max alt 17,000 ft.

APU electrical load: max alt 41,000 ft.

Non–AFM Operational Information

APU bleed valve must be closed when:

- ground air connected and isolation valve open
- engine no. 1 bleed valve open
- isolation and engine no. 2 bleed valves open.

APU bleed valve may be open during engine start, but avoid engine power above idle.

After three consecutive aborted start attempts, a fifteen minute cooling period is required.

Run the APU for two full minutes before using it as a bleed air source.

Flight Controls

AFM Limitations

The maximum altitude with flaps extended is 20,000 ft.

Holding in icing conditions with flaps extended is prohibited.
[Option - 737-600/-700/-800 without stiffened elevator tabs]
(PRR 38506 or Service Bulletin 737-55A1080)
Do not operate the airplane at speeds in excess of 300 KIAS with speedbrakes extended.

WARNING: Use of speedbrakes at speeds in excess of 320 KIAS could result in a severe vibration, which, in turn, could cause extreme damage to the horizontal stabilizer.

In flight, do not extend the SPEED BRAKE lever beyond the FLIGHT DETENT.

Avoid rapid and large alternating control inputs, especially in combination with large changes in pitch, roll, or yaw (e.g. large side slip angles) as they may result in structural failure at any speed, including below VA.

[Option - EASA rules]
Airplanes operating with EASA Certification: Flaps 15 normal landings are prohibited. A Flaps 15 landing may be performed when required by a non-normal procedure.

Non–AFM Operational Information

Do not deploy the speedbrakes in flight at radio altitudes less than 1,000 feet.

Alternate flap duty cycle:

- When extending or retracting flaps with the ALTERNATE FLAPS position switch, allow 15 seconds after releasing the ALTERNATE FLAPS position switch before moving the switch again to avoid damage to the alternate flap motor clutch
- After a complete extend/retract cycle, i.e., 0 to 15 and back to 0, allow 5 minutes cooling before attempting another extension.

Flight Management, Navigation

AFM Limitations

Air Data Inertial Reference Unit (ADIRU)

ADIRU alignment must not be attempted at latitudes greater than 78 degrees 15 minutes.

All flight operations based on magnetic heading or magnetic track angle are prohibited in geographic areas where the installed IRS MagVar table errors are greater than 5 degrees.

Refer to AFM Normal Procedures/Inertial Reference System section for procedures to determine the geographic areas and magnitude of MagVar errors for the specific MagVar table installed in the IRS and if any of these limitations apply.

[Option - Cat IIIB]
For Fail-Operational Autopilot, all autopilot/flight director ILS (and GLS, if installed) approach and landing operations that use magnetic north referenced courses or bearings are prohibited in geographic areas where the installed IRS MagVar table errors are greater than 3 degrees.

QFE Selection

[Option - Altimeters with QFE]
The use of VNAV or LNAV with the altimeters referenced to QFE is prohibited.

[Option - Vertical Situation Display]
The use of the Vertical Situation Display (VSD) with the altimeters referenced to QFE is prohibited.

QFE operations are prohibited if the option for QFE altitude reference selection is not installed in the Flight Management System (FMS).

[Option - With PFD/ND]
A QFE altitude reference for the PFDs must be selected in the FMS whenever QFE is used instead of QNH.

[Option - With Look-Ahead terrain alerting and without GPS]
The use of Look-Ahead terrain alerting and terrain display functions with the altimeters referenced to QFE is prohibited.

Look-Ahead Terrain Alerting (GPWS)

[Option - With Enhanced GPWS]
Do not use the terrain display for navigation.

Do not use the look-ahead terrain alerting and terrain display functions:

- within 15 nm of takeoff, approach or landing at an airport or runway not contained in the GPWS terrain database.

Note: Refer to Honeywell Document 060-4267-000 for airports and runways contained in the installed GPWS terrain database.

Overrun Warning System (ORW)

[Option - With Overrun Warning System (ORW)]
The ORW alerting system does not replace the requirement to conduct an en route landing distance performance assessment prior to landing. The lack of an overrun alert does not guarantee the airplane can stop prior to reaching the runway end.

If the In-Air Overrun Warning ("OVERRUN, GO-AROUND") occurs during approach, execute an immediate go-around.

Inhibit the overrun alert when:

- Landing altitude is above 10,000 feet pressure altitude; or
- Landing OAT on the ground is below –40°C or greater than 50°C; or
- Gross Weight is greater than Maximum Landing Weight.

Non-AFM Operational Information

Avoid weather radar operation in a hangar.

Avoid weather radar operation when personnel are within the area normally enclosed by the aircraft nose radome.

Note: The hangar recommendation does not apply to the weather radar test mode.

Runway Awareness and Advisory System (RAAS)

[Option - With Runway Awareness and Advisory System]
Do not use RAAS callouts or alerts for navigation.

Do not use RAAS callouts or alerts as a substitute for NOTAM or ATIS information.

Fuel System

AFM Limitations

Maximum tank fuel temperature is 49°C.

Minimum tank fuel temperature prior to takeoff and inflight is –43°C, or 3°C above the fuel freezing point temperature, whichever is higher.

Note: The use of Fuel System Icing Inhibitor additives does not change the minimum fuel tank temperature limit.

Intentional dry running of a center tank fuel pump (low pressure light illuminated) is prohibited.

Fuel Balance

Lateral imbalance between main tanks 1 and 2 must be scheduled to be zero. Random fuel imbalance must not exceed 1000 lbs / 453 kgs for taxi, takeoff, flight or landing.

Fuel Loading

Main tanks 1 and 2 must be full if center tank contains more than 1000 lbs / 453 kgs.

Landing Gear

AFM Limitations

[Option - EASA rules]
Airplanes operating with EASA Certification: Towing operations without the use of a tow bar is restricted to tow vehicles that are designed and operated to preclude damage to the airplane steering system or which provide a reliable and unmistakable warning when damage to the steering system may have occurred.

Non–AFM Operational Information

Do not apply brakes until after touchdown.

Intentionally
Blank

Normal Procedures — Chapter NP
Table of Contents — Section TOC

Intentionally
Blank

Normal Procedures — Chapter NP
Introduction — Section 11

General

This chapter contains:

- an introduction to the normal procedures philosophy and assumptions
- step by step normal procedures.

Normal Procedures Philosophy and Assumptions

Normal procedures verify for each phase of flight that:

- the airplane condition is satisfactory
- the flight deck configuration is correct.

Normal procedures are done on each flight. Refer to the Supplementary Procedures (SP) chapter for procedures that are done as needed, for example the adverse weather procedures.

Normal procedures are written for a trained flight crew and assume:

- all systems operate normally
- the full use of all automated features (LNAV, VNAV, autoland, autopilot, and autothrottle). This does not preclude the possibility of manual flight for pilot proficiency where allowed

Normal procedures also assume coordination with the ground crew before:

- hydraulic system pressurization, or
- flight control surface movement, or
- airplane movement.

Normal procedures do not include steps for flight deck lighting and crew comfort items.

Normal procedures are done by memory and scan flow. The panel illustration in this section shows the scan flow. The scan flow sequence may be changed as needed.

Configuration Check

It is the crew member's responsibility to verify correct system response. Before engine start, use system lights to verify each system's condition or configuration. After engine start, the master caution system alerts the crew to warnings or cautions away from the normal field of view.

If there is an incorrect configuration or response:

- verify that the system controls are set correctly
- check the respective circuit breaker as needed. Maintenance must first determine that it is safe to reset a tripped circuit breaker on the ground
- test the respective system light as needed

Before engine start, use individual system lights to verify the system status. If an individual system light indicates an improper condition:

- check the Dispatch Deviations Guide (DDG) or the operator equivalent to decide if the condition has a dispatch effect
- decide if maintenance is needed

If, during or after engine start, a red warning or amber caution light illuminates:

- do the respective non-normal checklist (NNC)
- on the ground, check the DDG or the operator equivalent

If, during recall, an amber caution illuminates and then extinguishes after a master caution reset:

- check the DDG or the operator equivalent
- the respective non-normal checklist is not needed

Crew Duties

Preflight and postflight crew duties are divided between the captain and first officer. Phase of flight duties are divided between the Pilot Flying (PF) and the Pilot Monitoring (PM).

Each crewmember is responsible for moving the controls and switches in their area of responsibility:

- the phase of flight areas of responsibility for both normal and non-normal procedures are shown in the Area of Responsibility illustrations in this section. Typical panel locations are shown
- the preflight and postflight areas of responsibility are defined by the “Preflight Procedure - Captain” and “Preflight Procedure - First Officer.”

The captain may direct actions outside of the crewmember’s area of responsibility.

The general PF phase of flight responsibilities are:

- taxiing
- flight path and airspeed control
- airplane configuration
- navigation.

The general PM phase of flight responsibilities are:

- checklist reading
- communications

- tasks asked for by the PF
- monitoring taxiing, flight path, airspeed, airplane configuration and navigation.

PF and PM duties may change during a flight. For example, the captain could be the PF during taxi but be the PM during takeoff through landing.

Normal procedures show who does a step by crew position (C, F/O, PF, or PM):

- in the procedure title, or
- in the far right column, or
- in the column heading of a table

The mode control panel is the PF’s responsibility. When flying manually, the PF directs the PM to make the changes on the mode control panel.

The captain is the final authority for all tasks directed and done.

Control Display Unit (CDU) Procedures

Before taxi, the captain or first officer may make CDU entries. The other pilot must verify the entries.

Make CDU entries before taxi or when stopped, when possible. If CDU entries must be made during taxi, the PM makes the entries. The PF must verify the entries before they are executed.

In flight, the PM usually makes the CDU entries. The PF may also make simple, CDU entries when the workload allows. The pilot making the entries executes the change only after the other pilot verifies the entries.

During high workload times, for example departure or arrival, try to reduce the need for CDU entries. Do this by using the MCP heading, altitude, and speed control modes. The MCP can be easier to use than entering complex route modifications into the CDU.

Autopilot Flight Director System (AFDS) Procedures

The crew must always monitor:

- airplane course
- vertical path
- speed

When selecting a value on the MCP, verify that the respective value changes on the flight instruments, as applicable.

The crew must verify manually selected or automatic AFDS changes. Use the FMA to verify mode changes for the:

- autopilot
- flight director
- autothrottle

During LNAV and VNAV operations, verify all changes to the airplane's:

- course
- vertical path
- thrust
- speed

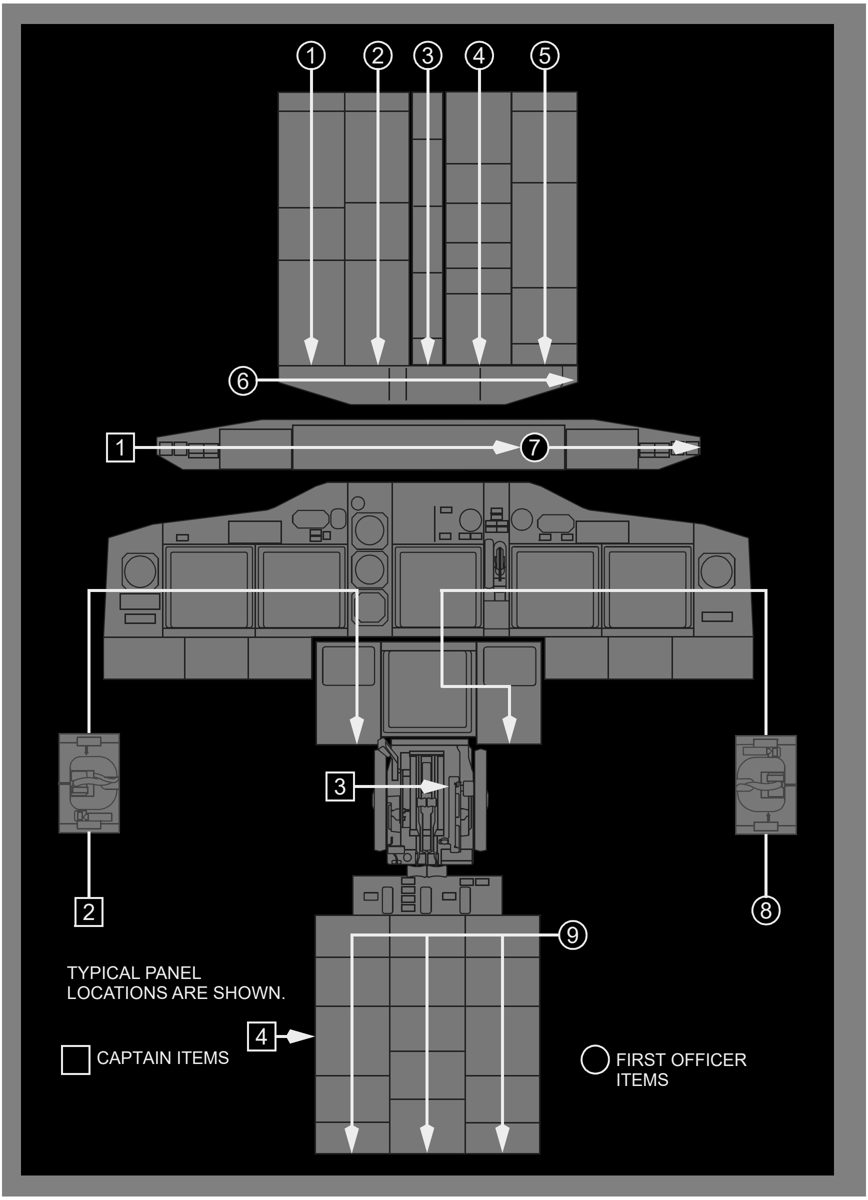
Announcing changes on the FMA and thrust mode display when they occur is a good CRM practice.

Scan Flow and Areas of Responsibility

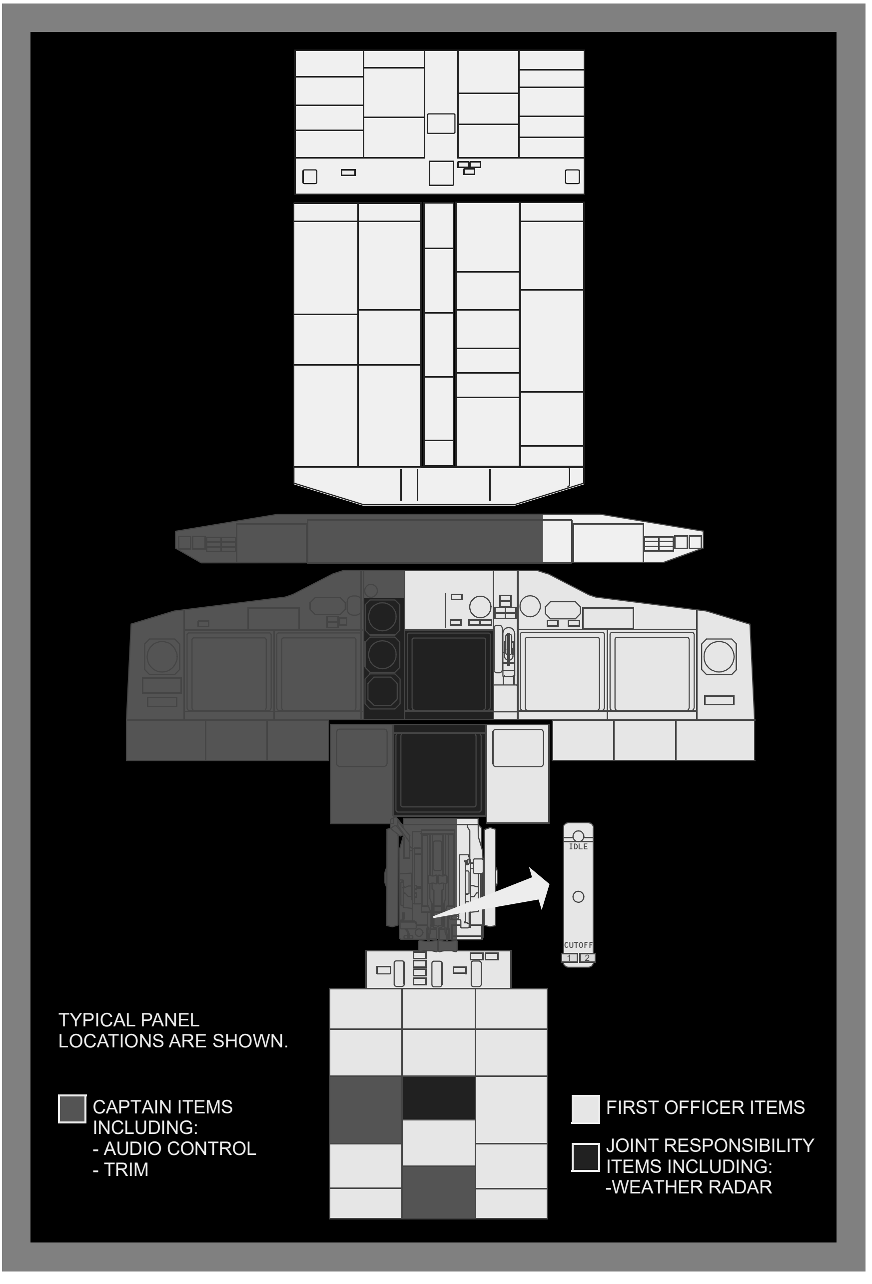
The scan flow and areas of responsibility diagrams shown below are representative and may not match the configuration(s) of your airplanes.

The scan flow diagram provides general guidance on the order each flight crew member should follow when doing the preflight and postflight procedures. Specific guidance on the items to be checked are detailed in the amplified Normal Procedures. For example, preflight procedure details are in the Preflight Procedure - Captain and Preflight Procedure - First Officer.

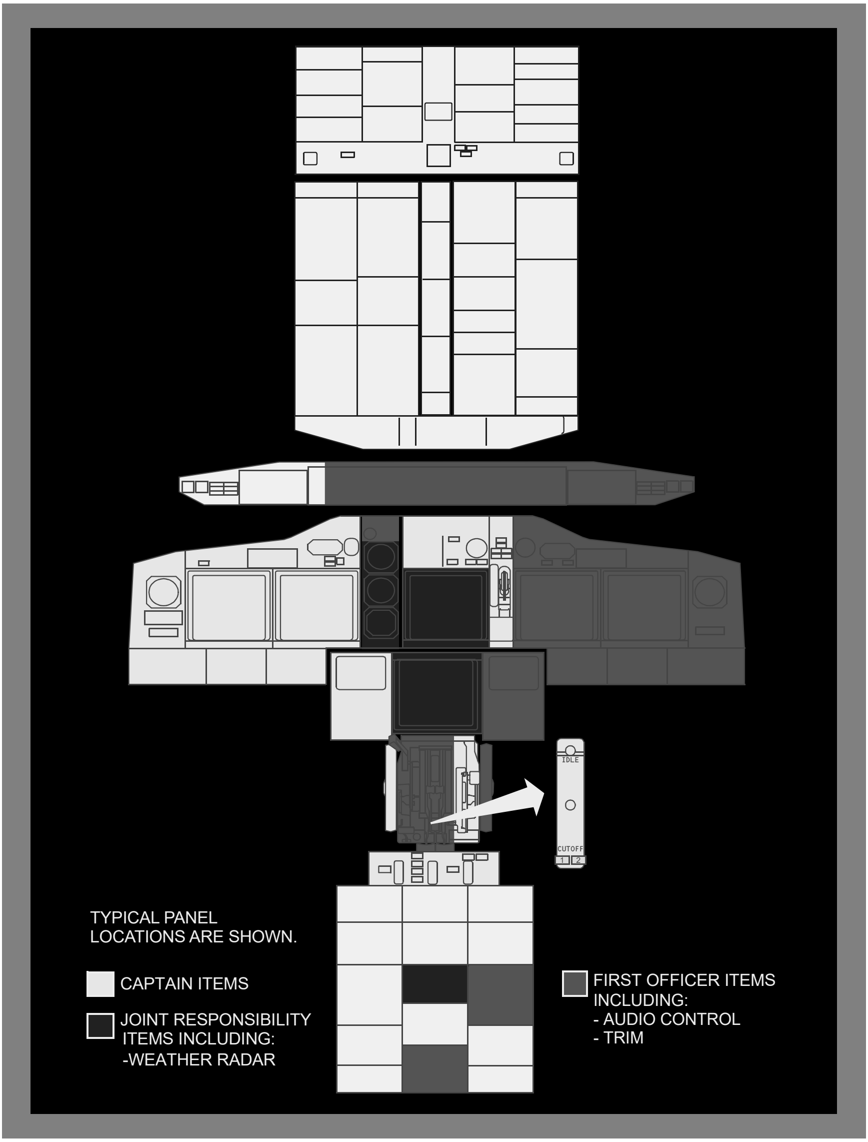
Preflight and Postflight Scan Flow



Areas of Responsibility - Captain as Pilot Flying or Taxiing



Areas of Responsibility - First Officer as Pilot Flying or Taxiing



Intentionally
Blank

Preliminary Preflight Procedure – Captain or First Officer

The Preliminary Preflight Procedure assumes that the Electrical Power Up supplementary procedure is complete.

A full IRS alignment is recommended before each flight. If time does not allow a full alignment, do the Fast Realignment supplementary procedure.

IRS mode selectors .... OFF, then NAV

Verify that the ON DC lights illuminate then extinguish.

Verify that the ALIGN lights are illuminated.

The UNABLE REQD NAV PERF-RNP message may show until IRS alignment is complete.

[Option]
VOICE RECORDER switch ....As needed

Verify that the following are sufficient for flight:

- oxygen pressure
- hydraulic quantity
- engine oil quantity

Do the remaining actions after a crew change or maintenance action.

Note: The following oxygen pressure drop test only needs to be performed at one crewmember or observer station.

[Option - Oronasal Oxygen Mask]
Oxygen pressure drop ....Test

[Chemical passenger oxygen]
Note the crew oxygen pressure.

[Gaseous passenger oxygen]
Note the crew/pass oxygen pressure.

Oxygen mask – Stowed and doors closed

RESET/TEST switch – Push and hold

Verify that the yellow cross shows momentarily in the flow indicator.

EMERGENCY/Test selector – Push and hold

Continue to hold the RESET/TEST switch down and push the EMERGENCY/Test selector for 5 seconds. Verify that the yellow cross shows continuously in the flow indicator.

Verify that the crew oxygen pressure does not decrease more than 100 psig.

If the oxygen cylinder valve is not in the full open position, pressure can:

- decrease rapidly, or
- decrease more than 100 psig, or
- increase slowly back to normal.

Release the RESET/TEST switch and the EMERGENCY/Test selector. Verify that the yellow cross does not show in the flow indicator.

Normal/100% switch – 100%

[Chemical passenger oxygen]
Crew oxygen pressure - Check.

Verify that the pressure is sufficient for dispatch.

[Gaseous passenger oxygen]
Crew/pass oxygen pressure - Check.

Verify that the pressure is sufficient for dispatch.

[Option - EROS Full Face Oxygen Mask]
Oxygen pressure drop ....Test

[Chemical passenger oxygen]
Note the crew oxygen pressure.

[Gaseous passenger oxygen]
Note the crew/pass oxygen pressure.

Oxygen mask – Stowed and doors closed

TEST/RESET switch – Push and hold

Verify that the yellow cross shows momentarily in the flow indicator.

EMERGENCY/Test selector – Push and hold

Continue to hold the TEST/RESET switch down and push the EMERGENCY/Test selector for 5 seconds. Verify that the yellow cross shows continuously in the flow indicator.

Verify that the crew oxygen pressure does not decrease more than 100 psig.

If the oxygen cylinder valve is not in the full open position, pressure can:

- decrease rapidly, or
- decrease more than 100 psig, or
- increase slowly back to normal.

Release the TEST/RESET switch and the EMERGENCY/Test selector. Verify that the yellow cross does not show in the flow indicator.

Normal/100% switch – 100%

[Chemical passenger oxygen]
Crew oxygen pressure - Check.

Verify that the pressure is sufficient for dispatch.

[Gaseous passenger oxygen]
Crew/pass oxygen pressure - Check.

Verify that the pressure is sufficient for dispatch.

Maintenance documents .... Check

[Option]
FLIGHT DECK ACCESS SYSTEM switch ....Guard closed

Emergency equipment .... Check

Fire extinguisher – Checked and stowed

Crash axe – Stowed

Escape ropes – Stowed

Other needed equipment – Checked and stowed

ELT switch ....Guard closed

Verify that the ELT light is extinguished.

PSEU light .... Verify extinguished

SPSEU light .... Verify extinguished

GPS light .... Verify extinguished

[Option - GLS]
ILS light .... Verify extinguished

[Option - GLS]
GLS light .... Verify extinguished

SERVICE INTERPHONE switch .... OFF

ENGINE panel .... Set

Verify that the REVERSER lights are extinguished.

Verify that the ENGINE CONTROL lights are extinguished.

EEC switches – ON

Oxygen panel .... Set

Note: PASSENGER OXYGEN switch activation causes deployment of the passenger oxygen masks.

Note: PASSENGER OXYGEN switch activation causes an audible horn and illuminates the DON OXYGEN sign in the supernumerary cabin.

PASSENGER OXYGEN switch - Guard closed

Verify that the PASS OXY ON light is extinguished.

Landing gear indicator lights .... Verify illuminated

FLIGHT RECORDER switch .... Guard closed

Verify that the OFF light is illuminated.

MACH AIRSPEED WARNING
TEST switches .... Push, one at a time

Verify that the clacker sounds.

STALL WARNING TEST switches. .... Push and hold, one at a time

Verify that each control column vibrates when the respective switch is pushed.

Note: The stall warning test requires that AC transfer busses are powered for up to 4 minutes.

Note: With hydraulic power off, the leading edge flaps can droop enough to cause an asymmetry signal, resulting in a failure of the stall warning system test. Should this occur, obtain a clearance to pressurize the hydraulic system, place the “B” system electric pump ON and retract the flaps. When flaps are retracted repeat the test. At the completion of the test, turn the “B” system electric pump “OFF”.

[Option]
Emergency EVACUATION activation switch .... Guard closed

Verify that the EVAC light is extinguished.

Circuit breakers (P6 panel) .... Check

Manual gear extension access door ....Closed

Circuit breakers (control stand, P18 panel) .... Check

Parking brake ....As needed

Set the parking brake if the brake wear indicators are to be checked during the exterior inspection.

CDU Preflight Procedure - Captain and First Officer

Start the CDU Preflight Procedure any time after the Preliminary Preflight Procedure. The Initial Data and Navigation Data entries must be complete before the flight instrument check during the Preflight Procedure. The Performance Data entries must be complete before the Before Start Checklist.

The captain or first officer may make CDU entries. The other pilot must verify the entries.

Enter data in all the boxed items on the following CDU pages.

Enter data in the dashed items or modify small font items that are listed in this procedure. Enter or modify other items at pilot's discretion.

Failure to enter enroute winds can result in flight plan time and fuel burn errors.

Initial Data ....Set

IDENT page:

Verify that the MODEL is correct.

Verify that the ENG RATING is correct.

Verify that the navigation data base ACTIVE date range is current.

POS INIT page:

Verify that the time is correct.

Enter the present position on the SET IRS POS line. Use the most accurate latitude and longitude.

Navigation Data ....Set

ROUTE page:

Enter the ORIGIN.

Enter the route.

Enter the FLIGHT NUMBER.

Activate and execute the route.

DEPARTURES page:

Select the runway and departure routing.

Execute the runway and departure routing.

LEGS page:

Verify the correct RNP for the departure as needed.

Verify that the route is correct on the RTE pages. Check the LEGS pages as needed to ensure compliance with the flight plan.

Performance Data .... Set

PERF INIT page:

CAUTION: Do not enter the ZFW into the GW boxes. The FMC will calculate performance data with significant errors.

Enter the ZFW.

Verify that the FUEL on the CDU, the dispatch papers, and the fuel quantity indicators agree.

If refueling is not complete, enter the PLAN trip fuel as needed.

Verify that the fuel is sufficient for flight.

Verify that the gross weight and cruise CG (GW/CRZ CG) on the CDU and the dispatch papers agree.

Thrust mode display:

[Option - Aspirated TAT]
Verify that TO shows.

[Option - Non-aspirated TAT]
Verify that dashes are shown.

[Option - FMC U 10.1 and later]
N1 LIMIT page:

[Option - Aspirated TAT]
Confirm the OAT value is correct and reasonable for the ambient conditions.

[Option - Non-aspirated TAT]
Enter or verify OAT. Confirm the OAT value is correct and reasonable for the ambient conditions.

Select an assumed temperature, or a fixed derate takeoff, or both as needed.

Select a full or a derated climb thrust as needed.

[Option - FMC U 10.1 and later]
TAKEOFF REF page:

Make data entries on page 2/2 before page 1/2.

Enter the CG.

Verify that a trim value is shown.

Select or enter the takeoff V speeds.

[Option - FMC U10.8 and later, FCC Collins P4 and later or FCC Honeywell 710 and later, and CDS BP06 and later]
Verify or enter an acceleration height.

[Option - FMC U10.8 and later, FCC Collins P4 and later or FCC Honeywell 710 and later, and CDS BP06 and later]
Verify or enter an engine out acceleration height.

[Option – With automatic thrust reduction after takeoff]
Verify or enter a thrust reduction altitude.

Verify that the preflight is complete.

Exterior Inspection

Before each flight the captain, first officer, or maintenance crew must verify that the airplane is satisfactory for flight.

Items at each location may be checked in any sequence.

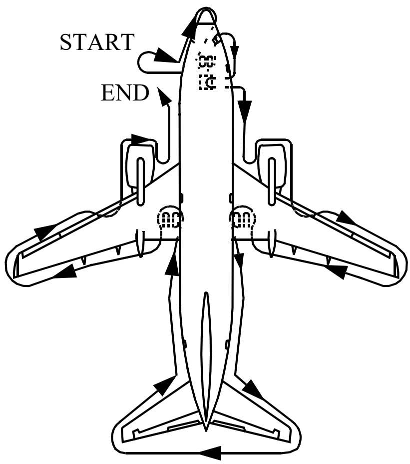
Use the detailed inspection route below to check that:

- the surfaces and structures are clear, not damaged, not missing parts and there are no fluid leaks*
- the tires are not too worn, not damaged, and there is no tread separation
- the gear struts are not fully compressed
- the engine inlets and tailpipes are clear, the access panels are secured, the fan cowls are latched, the exterior, including the bottom of the nacelles, is not damaged, and the reversers are stowed
- the doors and access panels that are not in use are latched
- the probes, vents, and static ports are clear and not damaged
- the skin area adjacent to the pitot probes and static ports is not wrinkled
- the antennas are not damaged
- the light lenses are clean and not damaged

For cold weather operations see the Supplementary Procedures.

Note: * Fluid leaks from the engine drains are allowed provided the leaks are less than a continuous stream. Refer to the Engine Start Procedure for additional guidance.

Inspection Route



Left Forward Fuselage

Probes, sensors, ports, vents, and drains (as applicable) .... Check

Doors and access panels (not in use) .... Latched

Nose

Radome .... Check

Conductor straps - Secure

Forward E and E door .... Secure

Nose Wheel Well

Tires and wheels .... Check

[Without LED Lighting System]
Exterior light .... Check

Gear strut and doors .... Check

Nose wheel steering assembly .... Check

Nose gear steering lockout pin .... As needed

Gear pin .... As needed

Nose wheel spin brake (snubbers) .... In place

Right Forward Fuselage

Probes, sensors, ports, vents, and drains (as applicable) .... Check

Oxygen pressure relief green disc .... In place

Doors and access panels (not in use) .... Latched

Right Wing Root, Pack, and Lower Fuselage

Ram air deflector door .... Extended

Pack and pneumatic access doors .... Secure

Probes, sensors, ports, vents, and drains (as applicable) .... Check

Exterior lights .... Check

Leading edge flaps .... Check

Number 2 Engine

Exterior surfaces
(including the bottom of the nacelles) .... Check for damage

Access panels and fan cowl latches .... Latched

Probes, sensors, ports, vents, and drains (as applicable) .... Check

Fan blades, probes, and spinner .... Check

Thrust reverser .... Stowed

Exhaust area and tailcone .... Check

Right Wing and Leading Edge

Access panels .... Latched

Leading edge flaps and slats .... Check

Fuel measuring sticks .... Flush and secure

Wing Surfaces .... Check

Fuel tank vent .... Check

Right Wing Tip and Trailing Edge

Position and strobe lights .... Check

Static discharge wicks .... Check

Aileron and trailing edge flaps .... Check

Right Main Gear

Tires, brakes and wheels .... Check

Verify that the wheel chocks are in place as needed.

If the parking brake is set, the brake wear indicator pins must extend out of the guides.

Gear strut, actuators, and doors .... Check

Hydraulic lines .... Secure

Gear pin .... As needed

Right Main Wheel Well

APU FIRE CONTROL handle .... Up

[Option]
NGS operability indicator light .... Check

Verify that the light is green.

Wheel well .... Check

Right Aft Fuselage

Doors and access panels (not in use) .... Latched

Negative pressure relief door .... Closed

Outflow valve .... Check

Probes, sensors, ports, vents, and drains (as applicable) .... Check

APU air inlet .... Check

Tail

Vertical stabilizer and rudder .... Check

Elevator feel probes .... Check

[737-800/900]
Tail skid .... Check

Verify that the tail skid is not damaged.

Horizontal stabilizer and elevator .... Check

Static discharge wicks .... Check

Strobe light .... Check

APU cooling air inlet and exhaust outlet .... Check

Left Aft Fuselage

Doors and access panels (not in use) ....Latched

Probes, sensors, ports, vents, and drains (as applicable) .... Check

Left Main Gear

Tires, brakes and wheels .... Check

Verify that the wheel chocks are in place as needed.

If the parking brake is set, the brake wear indicator pins must extend out of the guides.

Gear strut, actuators, and doors .... Check

Hydraulic lines ....Secure

Gear pin ....As needed

Left Main Wheel Well

Wheel well .... Check

Engine fire bottle pressure .... Check

Left Wing Tip and Trailing Edge

Aileron and trailing edge flaps .... Check

Static discharge wicks .... Check

Position and strobe lights .... Check

Left Wing and Leading Edge

Fuel tank vent .... Check

Wing Surfaces .... Check

Fuel measuring sticks .... Flush and secure

Leading edge flaps and slats .... Check

Access panels .... Latched

Number 1 Engine

Exhaust area and tailcone .... Check

Thrust reverser .... Stowed

Fan blades, probes, and spinner .... Check

Probes, sensors, ports, vents, and drains (as applicable) .... Check

Access panels and fan cowl latches .... Latched

Exterior surfaces
(including the bottom of the nacelles) .... Check for damage

Left Wing Root, Pack, and Lower Fuselage

Leading edge flaps .... Check

Probes, sensors, ports, vents, and drains (as applicable) .... Check

Exterior lights .... Check

Pack and pneumatic access doors .... Secure

Ram air deflector door .... Extended

Preflight Procedure – First Officer

The first officer normally does this procedure. The captain may do this procedure as needed.

Flight control panel .... Check

FLIGHT CONTROL switches – Guards closed

Verify that the flight control LOW PRESSURE lights are illuminated.

Flight SPOILER switches – Guards closed

YAW DAMPER switch – ON

Verify that the YAW DAMPER light is extinguished.

Verify that the standby hydraulic LOW QUANTITY light is extinguished.

Verify that the standby hydraulic LOW PRESSURE light is extinguished.

[Option - RSEP airplanes]
Verify that the STBY RUD ON light is extinguished.

ALTERNATE FLAPS master switch – Guard closed

ALTERNATE FLAPS position switch – OFF

Verify that the FEEL DIFF PRESS light is extinguished.

Verify that the SPEED TRIM FAIL light is extinguished.

Verify that the MACH TRIM FAIL light is extinguished.

Verify that the AUTO SLAT FAIL light is extinguished.

NAVIGATION panel ....Set

VHF NAV transfer switch – NORMAL

IRS transfer switch – NORMAL

[Option]
FMC source select switch – NORMAL

DISPLAYS panel ....Set

SOURCE selector – AUTO

CONTROL PANEL select switch – NORMAL

Fuel panel ....Set

Verify that the ENG VALVE CLOSED lights are illuminated dim.

Verify that the SPAR VALVE CLOSED lights are illuminated dim.

Verify that the FILTER BYPASS lights are extinguished.

CROSSFEED selector – Closed

Verify that the VALVE OPEN light is extinguished.

FUEL PUMP switches – OFF

Verify that the center tank fuel pump LOW PRESSURE lights are extinguished.

Verify that the main tank fuel pump LOW PRESSURE lights are illuminated.

Electrical panel ....Set

BATTERY switch – Guard closed

[Option]
CAB/UTIL power switch – ON

[Option]
IFE/PASS SEAT power switch – ON

STANDBY POWER switch – Guard closed

Verify that the STANDBY PWR OFF light is extinguished.

Verify that the BAT DISCHARGE light is extinguished.

Verify that the TR UNIT light is extinguished.

Verify that the ELEC light is extinguished.

Generator drive DISCONNECT switches – Guards closed

Verify that the DRIVE lights are illuminated.

BUS TRANSFER switch – Guard closed

Verify that the TRANSFER BUS OFF lights are extinguished.

Verify that the SOURCE OFF lights are extinguished.

Verify that the GEN OFF BUS lights are illuminated.

Overheat and fire protection panel .... Check

Do this check if the flight crew did not do the Electrical Power Up supplementary procedure. This check is needed once per flight day.

Verify that the engine No. 1, APU, and engine No. 2 fire switches are in.

Alert ground personnel before the following test is accomplished:

OVERHEAT DETECTOR switches – NORMAL

TEST switch – Hold to FAULT/INOP

Verify that the MASTER CAUTION lights are illuminated.

Verify that the OVHT/DET annunciator is illuminated.

Verify that the FAULT light is illuminated.

If the FAULT light fails to illuminate, the fault monitoring system is inoperative.

Verify that the APU DET INOP light is illuminated.

Do not run the APU if the APU DET INOP light does not illuminate.

Note: The fire warning light flashes and the horn sounds on the APU ground control panel when this test is done with the APU running. This can be mistaken by the ground crew as an APU fire.

TEST switch – Hold to OVHT/FIRE

Verify that the fire warning bell sounds.

Verify that the master FIRE WARN lights are illuminated.

Verify that the MASTER CAUTION lights are illuminated.

Verify that the OVHT/DET annunciator is illuminated.

Master FIRE WARN light – Push

Verify that the master FIRE WARN lights are extinguished.

Verify that the fire warning bell cancels.

Verify that the engine No. 1, APU and engine No. 2 fire switches stay illuminated.

[Airplanes with the NEW Engine Start Levers]
Verify that the engine No. 1 and engine No. 2 start lever lights stay illuminated.

Verify that the ENG 1 OVERHEAT and ENG 2 OVERHEAT lights stay illuminated.

Verify that the WHEEL WELL fire warning light stays illuminated.

EXTINGUISHER TEST switch – Check

TEST switch – Position to 1 and hold.

Verify that the three green extinguisher test lights are illuminated.

TEST switch – Release

Verify that the three green extinguisher test lights are extinguished.

Repeat for test position 2.

APU switch (as needed) ....START

Note: If extended APU operation is needed on the ground and the airplane busses are powered by AC electrical power, position an AC powered fuel pump ON. This extends the service life of the APU fuel control unit.

Note: If fuel is loaded in the center tank, position the left center tank fuel pump switch ON to prevent a fuel imbalance before takeoff.

CAUTION: Position the center tank fuel pump switches ON only if the fuel quantity in the center tank exceeds 453kgs/1000 lbs.

CAUTION: Do not operate the center tank fuel pumps with the flight deck unattended.

When the APU GEN OFF BUS light is illuminated:

APU GENERATOR bus switches – ON

Verify that the SOURCE OFF lights are extinguished.

Verify that the TRANSFER BUS OFF lights are extinguished.

Note: Run the APU for two full minutes before using it as a bleed air source.

[Option]
Lavatory SMOKE light ....Verify extinguished

EQUIPMENT COOLING switches .... NORM

Verify that the OFF lights are extinguished.

EMERGENCY EXIT LIGHTS switch ....Guard closed

Verify that the NOT ARMED light is extinguished.

Passenger signs .... Set

NO SMOKING switch – AUTO or ON

[Option]
NO ELECTRONIC DEVICES switch – AUTO or ON

FASTEN BELTS switch – AUTO or ON

Supernumerary signs .... Set

FASTEN BELTS switch – AUTO or ON

When refueling with supernumerary on board, the FASTEN BELTS switch shall remain off.

Windshield WIPER selectors ....PARK

Verify that the windshield wipers are stowed.

WINDOW HEAT switches .... ON

Position switches ON at least 10 minutes before takeoff.

Verify that the OVERHEAT lights are extinguished.

[Option - Green Power ON Indicator Lights]
Verify that the ON lights are illuminated (except at high ambient temperatures.)

[Option - Amber Power OFF Indicator Lights]
Verify that the OFF lights are extinguished (except at high ambient temperatures.)

[With automatic probe heat]
PROBE HEAT switches ....AUTO

Verify that all lights are illuminated.

[Without automatic probe heat]
PROBE HEAT switches .... OFF

Verify that all lights are illuminated.

WING ANTI–ICE switch .... OFF

Verify that the VALVE OPEN lights are extinguished.

[Option]
Verify that the ICE DETECTOR light is extinguished.

ENGINE ANTI–ICE switches .... OFF

Verify that the COWL ANTI–ICE lights are extinguished.

Verify that the COWL VALVE OPEN lights are extinguished.

Hydraulic panel ....Set

ENGINE HYDRAULIC PUMPS switches – ON

Verify that the LOW PRESSURE lights are illuminated.

ELECTRIC HYDRAULIC PUMPS switches – OFF

Verify that the OVERHEAT lights are extinguished.

Verify that the LOW PRESSURE lights are illuminated.

[Option]
High altitude landing switch ....As needed

Verify that the INOP light is extinguished

Air conditioning panel ....Set

AIR TEMPERATURE source selector – As needed

[737-800/900]
TRIM AIR switch – ON

[737-600/700]
Verify that the DUCT OVERHEAT lights are extinguished.

[737-800/900]
Verify that the ZONE TEMP lights are extinguished.

Temperature selectors – As needed

Verify that the RAM DOOR FULL OPEN lights are illuminated.

[737-600/700]
RECIRC FAN switch – AUTO

[737-800/900]
RECIRC FAN switches – AUTO

Air conditioning PACK switches – AUTO or HIGH

ISOLATION VALVE switch – OPEN

Engine BLEED air switches – ON

APU BLEED air switch – ON

Verify that the DUAL BLEED light is illuminated.

[737-600/700]
Verify that the PACK TRIP OFF lights are extinguished.

[737-800/900]
Verify that the PACK lights are extinguished.

Verify that the WING–BODY OVERHEAT lights are extinguished.

Verify that the BLEED TRIP OFF lights are extinguished.

Cabin pressurization panel .... Set

Verify that the AUTO FAIL light is extinguished.

Verify that the OFF SCHED DESCENT light is extinguished.

FLIGHT ALTITUDE indicator – Cruise altitude

LANDING ALTITUDE indicator – Destination field elevation

Pressurization mode selector – AUTO

Verify that the ALTN light is extinguished.

Verify that the MANUAL light is extinguished.

Lighting panel .... Set

[Without LED Lighting System]
LANDING light switches – RETRACT and OFF

[With LED Lighting System]
LANDING light switches - OFF

RUNWAY TURNOFF light switches – OFF

TAXI light switch – OFF

Ignition select switch .... IGN L or R

Alternate the ignition select switch position on subsequent starts.

[Without automatic ignition]
ENGINE START switches .... OFF

[Automatic ignition]
ENGINE START switches ....AUTO

Lighting panel ....Set

[Option - LOGO light switch]
LOGO light switch – As needed

POSITION light switch – As needed

ANTI–COLLISION light switch – OFF

WING illumination switch – As needed

WHEEL WELL light switch – As needed

Mode control panel ....Set

COURSE(S) – Set

FLIGHT DIRECTOR switch – ON

Move the switch for the pilot flying to ON first.

EFIS control panel ....Set

MINIMUMS reference selector – RADIO or BARO

MINIMUMS selector – Set decision height or altitude reference

[Option]
FLIGHT PATH VECTOR switch – As needed

METERS switch – As needed

BAROMETRIC reference selector – IN or HPA

BAROMETRIC selector – Set local altimeter setting

VOR/ADF switches – As needed

Mode selector – MAP

CENTER switch – As needed

Range selector – As needed

TRAFFIC switch – As needed

WEATHER RADAR – Off

Verify that the weather radar indications are not shown on the MAP.

Map switches – As needed

Note: The oxygen test and set is not needed if the oxygen pressure drop test was done at this crewmembers station during the Preliminary Preflight Procedure - Captain or First Officer.

[Option - Oronasal Oxygen Mask]
Oxygen .... Test and set

Oxygen mask – Stowed and doors closed

RESET/TEST switch – Push and hold

Verify that the yellow cross shows momentarily in the flow indicator.

RESET/TEST switch – Release

Normal/100% switch – 100%

EMERGENCY/TEST selector – Normal (non-emergency)

[Option - EROS Full Face Oxygen Mask]
Oxygen .... Test and set

Oxygen mask – Stowed and doors closed

TEST/RESET switch – Push and hold

Verify that the yellow cross shows momentarily in the flow indicator.

TEST/RESET switch - Release

Normal/100% switch – 100%

EMERGENCY/TEST selector – Normal (non-emergency)

[Option - Electronic Flight Bag]
ELECTRONIC FLIGHT BAG .... Set

Clock .... Set

Display select panel .... Set

MAIN PANEL DISPLAY UNITS selector – NORM

LOWER DISPLAY UNIT selector – NORM

TAKEOFF CONFIG light
(if installed and operative) .... Verify extinguished

CABIN ALTITUDE light
(if installed and operative) .... Verify extinguished

Disengage light TEST switch ....Hold to 1

Verify that the A/P light is illuminated steady amber.

Verify that the A/T light is illuminated steady amber.

Verify that the FMC light is illuminated steady amber.

Disengage light TEST switch ....Hold to 2

Verify that the A/P light is illuminated steady red.

Verify that the A/T light is illuminated steady red.

Verify that the FMC light is illuminated steady amber.

Do the Initial Data and Navigation Data steps from the CDU Preflight Procedure and verify that the IRS alignment is complete before checking the flight instruments.

Flight instruments .... Check

Verify that the flight instrument indications are correct.

Verify that only these flags are shown:

- TCAS OFF
- NO VSPD until V–speeds are selected

Verify that the flight mode annunciations are correct:

- autothrottle mode is blank
- roll mode is blank
- pitch mode is blank
- AFDS status is FD.

Select the map mode.

[Option]
BRAKE TEMP light .... Verify extinguished

GROUND PROXIMITY panel .... Check

FLAP INHIBIT switch – Guard closed

GEAR INHIBIT switch – Guard closed

TERRAIN INHIBIT switch – Guard closed

[Option - With Runway Awareness and Advisory System]
RUNWAY INHIBIT switch – Guard closed

Verify that the GROUND PROXIMITY INOP light is extinguished.

[Option - With Runway Awareness and Advisory System]
Verify that the RUNWAY INOP light is extinguished

The RUNWAY INOP light can be illuminated until the GPS accuracy is adequate for the Runway Awareness and Advisory System requirements.

Landing gear panel .... Set

LANDING GEAR lever – DN

Verify that the green landing gear indicator lights are illuminated.

Verify that the red landing gear indicator lights are extinguished.

AUTO BRAKE select switch .... RTO

Verify that the AUTO BRAKE DISARM light is extinguished

ANTISKID INOP light .... Verify extinguished

Engine display control panel .... Set

N1 SET selector – AUTO

SPEED REFERENCE selector – AUTO

FUEL FLOW switch – RATE

Move switch to RESET, then RATE.

Engine instruments .... Check

Verify that the primary and secondary engine indications show existing conditions.

Verify that no exceedance is shown.

[Option]
Verify that the hydraulic quantity indications do not show RF.

[Option - Fail Operational airplanes]
MFD Cancel/Recall switch – Push

Verify that the autoland status advisory messages are not shown.

CARGO FIRE panel .... Check

This check is needed once per flight day.

Flight deck door – Open

[Option - Airplanes w/o Aux Fuel Tanks, or Airplanes with Aux Fuel Tanks and a Modified Cargo Fire System]
DETECTOR SELECT switches – NORM

TEST switch – Push

Verify that the fire warning bell sounds.

Verify that the master FIRE WARN lights are illuminated.

Master FIRE WARN light – Push

Verify that the master FIRE WARN lights are extinguished.

Verify that the fire warning bell cancels.

Verify that the green EXTINGUISHER test lights stay illuminated.

[Option - Passenger Airplanes]
Verify that the FWD and AFT cargo fire warning lights stay illuminated.

Verify that the DETECTOR FAULT light stays extinguished.

Verify that the DISCH light stays illuminated.

[Option]
HUD system .... As needed

[Option]
Radio tuning panel ....Set

WARNING: Do not key the HF radio while the airplane is being fueled. Injury to personnel or fire can occur.

Verify that the OFF light is extinguished.

[Option]
VHF communications radios ....Set

VHF NAVIGATION radios .... Set for departure

Audio control panel ....Set

ADF radios ....Set

WEATHER RADAR control panel ....Set

Transponder panel ....Set

STABILIZER TRIM override switch ....Guard closed

WARNING: Do not put objects between the seat and the aisle stand. Injury can occur when the seat is adjusted.

Seat .... Adjust

Use the handhold above the forward window for assistance when pulling the seat forward. Do not use the glareshield as damage can occur.

Adjust the seat for optimum eye reference.

Whenever the seat is adjusted, verify a positive horizontal (fore and aft) seat lock by pushing against the seat.

Rudder pedals .... Adjust

Adjust the rudder pedals to allow full rudder pedal and brake pedal movement.

CAUTION: Turn the rudder pedal adjust crank no faster than approximately one turn per second to avoid damage. Do not apply force to the pedals during adjustment.

Seat belt and shoulder harness .... Adjust

Do the PREFLIGHT checklist on the captain's command.

Preflight Procedure – Captain

The captain normally does this procedure. The first officer may do this procedure if needed.

Lights ....Test

Master LIGHTS TEST and DIM switch – TEST

The fire warning lights are not checked during this test. Use individual test switches or push to test features to check lights which do not illuminate during the light test. Use scan flow to verify that all other lights are flashing or illuminated. Verify that all system annunciator panel lights are illuminated.

Master LIGHTS TEST and DIM switch – As needed

EFIS control panel ....Set

MINIMUMS reference selector – RADIO or BARO

MINIMUMS selector – Set decision height or altitude reference

[Option]
FLIGHT PATH VECTOR switch – As needed

METERS switch – As needed

BAROMETRIC reference selector – IN or HPA

BAROMETRIC selector – Set local altimeter setting

VOR/ADF switches – As needed

Mode selector – MAP

CENTER switch – As needed

Range selector – As needed

TRAFFIC switch – As needed

WEATHER RADAR – Off

Verify that the weather radar indications are not shown on the MAP.

Map switches – As needed

Mode control panel ....Set

COURSE(S) – Set

FLIGHT DIRECTOR switch – ON

Move the switch for the pilot flying to ON first.

Bank angle selector – As needed

Autopilot DISENGAGE bar – UP

Note: The oxygen test and set is not needed if the oxygen pressure drop test was done at this crewmember station during the Preliminary Preflight Procedure - Captain or First Officer.

[Option - Oronasal Oxygen Mask]
Oxygen ....Test and set

Oxygen mask – Stowed and doors closed

RESET/TEST switch – Push and hold

Verify that the yellow cross shows momentarily in the flow indicator.

RESET/TEST switch – Release

Normal/100% switch – 100%

EMERGENCY/TEST selector – Normal (non-emergency)

[Option - EROS Full Face Oxygen Mask]
Oxygen ....Test and set

Oxygen mask – Stowed and doors closed

TEST/RESET switch – Push and hold

Verify that the yellow cross shows momentarily in the flow indicator.

TEST/RESET switch – Release

Normal/100% switch – 100%

EMERGENCY/TEST selector – Normal (non-emergency)

[Option - Electronic Flight Bag]
ELECTRONIC FLIGHT BAG .... Set

Clock .... Set

NOSE WHEEL STEERING switch .... Guard closed

Display select panel .... Set

MAIN PANEL DISPLAY UNITS selector – NORM

LOWER DISPLAY UNIT selector – NORM

TAKEOFF CONFIG light
(if installed and operative) .... Verify extinguished

CABIN ALTITUDE light
(if installed and operative) .... Verify extinguished

Disengage light TEST switch .... Hold to 1

Verify that the A/P light is illuminated steady amber.

Verify that the A/T light is illuminated steady amber.

Verify that the FMC light is illuminated steady amber.

Disengage light TEST switch .... Hold to 2

Verify that the A/P light is illuminated steady red.

Verify that the A/T light is illuminated steady red.

Verify that the FMC light is illuminated steady amber.

STAB OUT OF TRIM light .... Verify extinguished

Do the Initial Data and Navigation Data steps from the CDU Preflight Procedure and verify that the IRS alignment is complete before checking the flight instruments.

Flight instruments .... Check

Verify that the flight instrument indications are correct.

Verify that only these flags are shown:

- TCAS OFF
- NO VSPD until V–speeds are selected

Verify that the flight mode annunciations are correct:

- autothrottle mode is blank
- roll mode is blank
- pitch mode is blank
- AFDS status is FD

Select the map mode.

[Option - without Integrated Standby Flight Display]
Standby instruments .... Check

Standby attitude indicator – Set

Gyro caging control – Pull, then release

Approach mode selector – OFF

Verify that the flight instrument indications are correct.

Verify that no flags are shown.

Standby altimeter – Set

Verify that the flight instrument indications are correct.

Verify that no flags are shown.

[Option - with Integrated Standby Flight Display]
Integrated standby flight display ....Set

Verify that the approach mode display is blank.

Set the altimeter.

Verify that the flight instrument indications are correct.

Verify that no flags or messages are shown.

[Option]
Standby RMI ....Set

Select either VOR or ADF.

Verify only expected flags are shown.

SPEED BRAKE lever ....DOWN detent

Verify that the SPEED BRAKE ARMED light is extinguished.

Verify that the SPEED BRAKE DO NOT ARM light is extinguished.

Verify that the SPEEDBRAKES EXTENDED light is extinguished.

Reverse thrust levers .... Down

Forward thrust levers ....Closed

FLAP lever .... Set

Set the flap lever to agree with the flap position.

[Option]
Verify that the FLAP LOAD RELIEF light is extinguished.

Parking brake .... Set

Verify that the parking brake warning light is illuminated

Note: Do not assume that the parking brake can prevent airplane movement. Accumulator pressure can be insufficient.

Engine start levers .... CUTOFF

STABILIZER TRIM cutout switches .... NORMAL

[Option]
HUD system .... As needed

[Option]
Radio tuning panel .... Set

WARNING: Do not key the HF radio while the airplane is being fueled. Injury to personnel or fire can occur.

Verify that the OFF light is extinguished.

[Option]
VHF communications radios .... Set

VHF NAVIGATION radios .... Set for departure

Audio control panel .... Set

WARNING: Do not put objects between the seat and the aisle stand. Injury can occur when the seat is adjusted.

Seat .... Adjust

Use the handhold above the forward window for assistance when pulling the seat forward. Do not use the glareshield as damage can occur.

Adjust the seat for optimum eye reference.

Whenever the seat is adjusted, verify a positive horizontal (fore and aft) seat lock by pushing against the seat.

Rudder pedals .... Adjust

Adjust the rudder pedals to allow full rudder pedal and brake pedal movement.

CAUTION: Turn the rudder pedal adjust crank no faster than approximately one turn per second to avoid damage. Do not apply force to the pedals during adjustment.

Seat belt and shoulder harness .... Adjust

Call "PREFLIGHT CHECKLIST."

Before Start Procedure

Start the Before Start Procedure after papers are on board.

Flight deck door ....Closed and locked F/O

Verify that the LOCK FAIL light is extinguished.

Do the CDU Preflight Procedure – Performance Data steps before completing this procedure.

CDU display ....Set C, F/O

Normally the PF selects the TAKEOFF REF page.

Normally the PM selects the LEGS page.

N1 bugs ....Check C, F/O

Verify that the N1 reference bugs are correct.

IAS bugs ....Set C, F/O

[Option - EFIS/MAP]
Verify that the speed bugs are at V1, VR, V2 + 15, and flaps up maneuvering speed.

MCP ....Set C

AUTOTHROTTLE ARM switch – ARM

IAS/MACH selector – Set V2

Arm LNAV as needed

[Option - FMC U10.8 and later, FCC Collins P4 and later or FCC Honeywell 710 and later, and CDS BP06 and later]
Arm VNAV

Initial heading – Set

Initial altitude – Set

Taxi and Takeoff briefings ....Complete C, F/O

The pilot who will do the takeoff does the taxi and takeoff briefings.

As part of the takeoff briefing for the first flight of the day and following a change of either flight crew member, cabin altitude warning indications and memory item procedures must be briefed on airplanes in which the CABIN ALTITUDE and TAKEOFF CONFIG lights are not installed, or are installed but not activated. The briefing must contain the following information:

Whenever the intermittent warning horn sounds in flight at an airplane flight altitude above 10,000 feet MSL:

1. Immediately, don oxygen masks and set regulators to 100%.
2. Establish crew communications.
3. Do the CABIN ALTITUDE WARNING or Rapid Depressurization non-normal checklist.

Both pilots must verify on the overhead Cabin Altitude Panel that the cabin altitude is stabilized at or below 10,000 feet before removing oxygen masks.

Exterior doors .... Verify closed F/O

Flight deck windows ....Closed and locked C, F/O

Start clearance ....Obtain C, F/O

Obtain a clearance to pressurize the hydraulic systems.

Obtain a clearance to start the engines.

If pushback is needed:

Verify that the nose gear steering lockout pin is installed, or, if the nose gear steering lockout pin is not used, depressurize hydraulic system A during the hydraulic panel set step C, F/O

Fuel panel .... Set F/O

If the center tank fuel quantity exceeds 1,000 pounds/453 kilograms:

LEFT and RIGHT CENTER FUEL PUMPS switches – ON

Verify that the LOW PRESSURE lights illuminate momentarily and then extinguish.

If the LOW PRESSURE light stays illuminated turn off the CENTER FUEL PUMPS switch.

AFT and FORWARD FUEL PUMPS switches – ON

Verify that the LOW PRESSURE lights are extinguished.

Hydraulic panel .... Set F/O

If pushback is needed and the nose gear steering lockout pin is not installed:

WARNING: Do not pressurize hydraulic system A. Unwanted tow bar movement can occur.

System A HYDRAULIC PUMP switches – OFF

Verify that the system A pump LOW PRESSURE lights are illuminated.

System B electric HYDRAULIC PUMP switch – ON

Verify that the system B electric pump LOW PRESSURE light is extinguished.

Verify that the brake pressure is 2,800 psi minimum.

Verify that the system B pressure is 2,800 psi minimum.

If pushback is not needed, or if pushback is needed and the nose gear steering lockout pin is installed:

Electric HYDRAULIC PUMP switches – ON

Verify that the electric pump LOW PRESSURE lights are extinguished.

Verify that the brake pressure is 2,800 psi minimum.

Verify that the system A and B pressures are 2,800 psi minimum.

ANTI COLLISION light switch .... ON F/O

Trim .... Set C

Check each trim for freedom of movement.

Stabilizer trim – ___ UNITS

Set the trim for takeoff.

Verify that the trim is in the green band.

Aileron trim – 0 units

Rudder trim – 0 units

Call “BEFORE START CHECKLIST.” C

Do the BEFORE START checklist. F/O

Pushback or Towing Procedure

The Engine Start procedure may be done during pushback or towing.

Establish communications with ground handling personnel. C

CAUTION: Do not hold or turn the nose wheel steering wheel during pushback or towing. This can damage the nose gear or the tow bar.

CAUTION: Do not use airplane brakes to stop the airplane during pushback or towing. This can damage the nose gear or the tow bar.

Transponder ....As needed F/O

Set or release the parking brake as directed by ground handling personnel. C or F/O

When pushback or towing is complete:

Verify that the tow bar is disconnected C

Verify that the nose gear steering lockout pin is removed C

System A HYDRAULIC PUMPS switches – ON F/O

Verify that the system A pump LOW PRESSURE lights are extinguished

Verify that the system A pressure is 2800 psi minimum.

Engine Start Procedure

Normal starter duty cycle:

- Multiple consecutive start attempts are permitted. Each start attempt is limited to 2 minutes of starter usage.
- A minimum of 10 seconds is needed between start attempts.

Extended engine motorings:

- Starter usage is limited to 15 minutes for the first two extended engine motorings. A minimum of 2 minutes is needed between each attempt.
- For the third and subsequent extended engine motorings, starter usage is limited to 5 minutes. A minimum of 10 minutes is needed between each attempt.

Normal engine start considerations:

- do not move an engine start lever to IDLE detent early or a hot start can occur
- keep a hand on the engine start lever while monitoring RPM, EGT and fuel flow until stable
- if fuel is shutoff accidentally (by closing the engine start lever) do not reopen the engine start lever in an attempt to restart the engine

- failure of the ENGINE START switch to stay in GRD until the starter cutout RPM can cause a hot start. Do not re–engage the ENGINE START switch until engine RPM is below 20% N2.
- If a fluid leak (other than a continuous stream) from any of the engine drains is discovered during the Exterior Inspection, the engine can be started. If during engine start, the ground crew reports a fluid leak from an engine drain, the engine start may be continued.
- If the fluid leak continues after the engine is stable at idle, do one of the following:
  - shut down the engine for maintenance action, or
  - run the engine at idle thrust for up to 5 minutes. If the fluid leak stops during this time, no maintenance action is needed, or
  - shut down and restart the engine. Run the engine at idle thrust for up to 5 minutes. If the fluid leak stops during this time, no maintenance action is needed.
- For the first flight of the day, at airport elevations at or above 2,000 feet MSL, if the temperature is below 5°C/41°F, consider placing the Ignition select switch to BOTH before starting the engines. This may increase the likelihood of a successful engine start on the first attempt.

Do the ABORTED ENGINE START checklist for one or more of the following abort start conditions:

- the N1 or N2 does not increase or increases very slowly after the EGT increases
- there is no oil pressure indication by the time that the engine is stable at idle
- the EGT does not increase by 15 seconds after the engine start lever is moved to IDLE detent
- the EGT quickly nears or exceeds the start limit

[Option]
Select the secondary engine indications. F/O

Air conditioning PACK switches ....OFF F/O

Start sequence ....Announce C

Call “START ___ ENGINE” C

ENGINE START switch ....GRD F/O

Verify that the N2 RPM increases. C, F/O

When N1 rotation is seen and N2 is at 25%, or (if 25% N2 is not possible), at maximum motoring and a minimum of 20% N2:

Note: Maximum motoring occurs when N2 acceleration is less than 1% in approximately 5 seconds.

[Option - New Engine Start Levers]

CAUTION: Do not apply rotational force when moving the engine start lever.

Engine start lever .... IDLE detent C

Monitor fuel flow and EGT indications. C, F/O

[Automatic ignition]
At 56% N2, verify that the ENGINE START switch moves to AUTO. If not, move the ENGINE START switch to AUTO. F/O

[Without automatic ignition]
At 56% N2, verify that the ENGINE START switch moves to OFF. If not, move the ENGINE START switch to OFF. F/O

[Automatic ignition]
Verify that the START VALVE OPEN alert extinguishes when the ENGINE START switch moves to AUTO. F/O

[Without automatic ignition]
Verify that the START VALVE OPEN alert extinguishes when the ENGINE START switch moves to OFF. F/O

Call “STARTER CUTOUT.” F/O

Monitor N1, N2, EGT, fuel flow and oil pressure for normal indications while the engine accelerates to a stable idle. C, F/O

After the engine is stable at idle, start the other engine.

Note: The engine is stable at idle when the EGT start limit redline is no longer shown.

Before Taxi Procedure

Start the Before Taxi Procedure after the engines are stable at idle.

GENERATOR 1 and 2 switches .... ON F/O

PROBE HEAT switches ....ON F/O

WING ANTI–ICE switch....................................As needed F/O

ENGINE ANTI–ICE switches ....As needed F/O

PACK switches .... AUTO F/O

ISOLATION VALVE switch .... AUTO F/O

APU BLEED air switch ....OFF F/O

APU switch ....OFF F/O

[Without automatic ignition]
ENGINE START switches .... CONT F/O

Engine start levers ....IDLE detent C

Verify that the ground equipment is clear. C, F/O

Call “FLAPS ___” as needed for takeoff. C

Flap lever ....Set takeoff flaps F/O

Verify that the LE FLAPS EXT green light is illuminated.

Flight controls ....Check C

[Option - Flight Control Surface Position Indicator]
Push the MFD SYS switch to display the flight control surface position indications on the lower display unit, if desired.

Make slow and deliberate inputs, one direction at a time.

Move the control wheel and the control column to full travel in both directions and verify:

- freedom of movement
- that the controls return to center

[Option - Flight Control Surface Position Indicator]
- correct flight control movement if the flight control surface position indications are displayed on the lower display unit.

Hold the nose wheel steering wheel during the rudder check to prevent nose wheel movement.

Move the rudder pedals to full travel in both directions and verify:

- freedom of movement
- that the rudder pedals return to center

[Option - Flight Control Surface Position Indicator]
- correct flight control movement if the flight control surface position indications are displayed on the lower display unit.

[Option]
Blank the lower display unit. F/O

Transponder .... As needed F/O

Recall ....Check C, F/O

Verify that all system annunciator panel lights illuminate and then extinguish.

[Option - Electronic Flight Bag]

CAUTION: Do not use the Airport Map application as a primary navigation reference. The Airport Map application is designed to aid flight crew positional awareness only.

EFB AIRPORT MAP application................................Select C, F/O

Select map as desired.

Update changes to the taxi briefing, as needed. C or PF

Call "BEFORE TAXI CHECKLIST." C

Do the BEFORE TAXI checklist. F/O

Before Takeoff Procedure

Engine warm up requirement:

- verify an increase in engine oil temperature before takeoff.

Engine warm up recommendations:

- run the engines for at least 2 minutes
- use a thrust setting normally used for taxi operations.

Pilot Flying	Pilot Monitoring
	[Passenger Airplanes] Notify the cabin crew to prepare for takeoff. Verify that the cabin is secure. [Freight Only Airplanes] Notify the supernumeraries to prepare for takeoff.
The pilot who will do the takeoff updates changes to the takeoff briefing as needed.	
Set the weather radar display as needed. [Option - with EGPWS] Set the terrain display as needed.	
Call "BEFORE TAKEOFF CHECKLIST."	Do the BEFORE TAKEOFF checklist.

Before Takeoff Procedure [AD 2002-19-52 and AD 2002-24-51]

Engine warm up requirement:

- verify an increase in engine oil temperature before takeoff.

Engine warm up recommendations:

- run the engines for at least 2 minutes
- use a thrust setting normally used for taxi operations.

Pilot Flying	Pilot Monitoring
	Check the center tank fuel quantity. Both center tank fuel pump switches must be OFF for takeoff if center tank fuel is less than 5000 pounds/2300 kilograms. Do not accomplish the CONFIG non-normal checklist with less than 5000 pounds/2300 kilograms in the center tank prior to takeoff.
	[Passenger Airplanes] Notify the cabin crew to prepare for takeoff. Verify that the cabin is secure.
The pilot who will do the takeoff updates changes to the takeoff briefing as needed.	
Set the weather radar display as needed. [Option - with EGPWS] Set the terrain display as needed.	
Call “BEFORE TAKEOFF CHECKLIST.”	Do the BEFORE TAKEOFF checklist.

Before Takeoff Procedure [Alternate Method of Compliance (AMOC) to AD 2002-24-51]

Engine warm up requirement:

- verify an increase in engine oil temperature before takeoff.

Engine warm up recommendations:

- run the engines for at least 2 minutes
- use a thrust setting normally used for taxi operations.

Pilot Flying	Pilot Monitoring
	Check the center tank fuel quantity. Both center tank fuel pump switches must be OFF for takeoff if center tank fuel is less than 5000 pounds/2300 kilograms. Do not accomplish the CONFIG non-normal checklist with less than 5000 pounds/2300 kilograms in the center tank prior to takeoff.
	[Passenger Airplanes] Notify the cabin crew to prepare for takeoff. Verify that the cabin is secure.
The pilot who will do the takeoff updates changes to the takeoff briefing as needed.	
Set the weather radar display as needed. [Option - with EGPWS] Set the terrain display as needed.	
Call “BEFORE TAKEOFF CHECKLIST.”	Do the BEFORE TAKEOFF checklist.

Before Takeoff Procedure [Alternate Method of Compliance (AMOC) to AD 2001-08-24 and AD 2002-24-51 for Airplanes with Master Caution System Logic Change and Automatic Shutoff]

Engine warm up requirement:

- verify an increase in engine oil temperature before takeoff.

Engine warm up recommendations:

- run the engines for at least 2 minutes
- use a thrust setting normally used for taxi operations.

Pilot Flying	Pilot Monitoring
	[Passenger Airplanes] Notify the cabin crew to prepare for takeoff. Verify that the cabin is secure.
The pilot who will do the takeoff updates changes to the takeoff briefing as needed.	
Set the weather radar display as needed. [Option - with EGPWS] Set the terrain display as needed.	
Call “BEFORE TAKEOFF CHECKLIST.”	Do the BEFORE TAKEOFF checklist.

Takeoff Procedure

[Option - With auto T/O thrust reduction and with FMC U10.8 and later, FCC Collins P4 and later or FCC Honeywell 710 and later and CDS BP06 and later]

Pilot Flying	Pilot Monitoring
	[Option - Runway position update with the CDU only] Update the FMC position to the runway threshold on the CDU TAKEOFF REF page.
Before entering the departure runway, verify that the runway and runway entry point are correct.	
	When entering the departure runway, set the STROBE light switch to ON. Use other lights as needed. Set the transponder mode selector to TA/RA.
Verify that the brakes are released. Align the airplane with the runway.	
Verify that the airplane heading agrees with the assigned runway heading.	
	[Without LED Lighting System] When cleared for takeoff, set the FIXED LANDING light switches to ON. [With LED Lighting System] When cleared for takeoff, set the LANDING light switches to ON.
Advance the thrust levers to approximately 40% N1. Allow the engines to stabilize.	
Push the TO/GA switch.	
Verify that the correct takeoff thrust is set.	

Pilot Flying	Pilot Monitoring
	Monitor the engine instruments during the takeoff. Call out any abnormal indications. Adjust takeoff thrust before 60 knots as needed. During strong headwinds, if the thrust levers do not advance to the planned takeoff thrust, manually advance the thrust levers before 60 knots. Call "THRUST SET".
After takeoff thrust is set, the captain’s hand must be on the thrust levers until V1.	
Monitor airspeed. Maintain light forward pressure on the control column.	Monitor airspeed and call out any abnormal indications.
Verify 80 knots and call “CHECK.”	Call “80 KNOTS.”
Verify V1 speed.	Verify the automatic V1 callout or call “V1.”
At VR, rotate toward 15° pitch attitude. After liftoff, follow F/D commands.	At VR, call “ROTATE.” Monitor airspeed and vertical speed.
Establish a positive rate of climb.	
	Verify a positive rate of climb on the altimeter and call “POSITIVE RATE.”
Verify a positive rate of climb on the altimeter and call “GEAR UP.”	
	Set the landing gear lever to UP.
Above 400 feet radio altitude, call for a roll mode as needed.	Select or verify the roll mode. Verify VNAV engaged.
At thrust reduction height, verify that climb thrust is set.	

Pilot Flying	Pilot Monitoring
Verify acceleration at the acceleration height. Call “FLAPS ___” according to the flap retraction schedule.	
	Set the FLAP lever as directed.
Engage the autopilot when above the minimum altitude for autopilot engagement.	
	After flap retraction is complete: • Set or verify engine bleeds and air conditioning packs are operating [Without automatic ignition] • Set the engine start switches as needed • Set the AUTO BRAKE select switch to OFF • Set the landing gear lever to OFF after landing gear retraction is complete.
Call “AFTER TAKEOFF CHECKLIST.”	
	Do the AFTER TAKEOFF checklist.

CAUTION: Do not allow the shoulder harness straps to retract quickly. Buckles can pull or damage circuit breakers.

Takeoff Procedure

[Option - Without auto T/O thrust reduction and with FMC U10.8 and later, FCC Collins P4 and later or FCC Honeywell 710 and later and CDS BP06 and later]

Pilot Flying	Pilot Monitoring
	[Option - Runway position update with the CDU only] Update the FMC position to the runway threshold on the CDU TAKEOFF REF page.
Before entering the departure runway, verify that the runway and runway entry point are correct.	
	When entering the departure runway, set the STROBE light switch to ON. Use other lights as needed. Set the transponder mode selector to TA/RA.
Verify that the brakes are released. Align the airplane with the runway.	
Verify that the airplane heading agrees with the assigned runway heading.	
	[Without LED Lighting System] When cleared for takeoff, set the FIXED LANDING light switches to ON. [With LED Lighting System] When cleared for takeoff, set the LANDING light switches to ON.
Advance the thrust levers to approximately 40% N1. Allow the engines to stabilize.	
Push the TO/GA switch.	
Verify that the correct takeoff thrust is set.	

<table>
<tr><th>Pilot Flying</th><th>Pilot Monitoring</th></tr>
<tr><td></td><td>Monitor the engine instruments during the takeoff. Call out any abnormal indications.
Adjust takeoff thrust before 60 knots as needed.
During strong headwinds, if the thrust levers do not advance to the planned takeoff thrust, manually advance the thrust levers before 60 knots.
Call "THRUST SET".</td></tr>
<tr><td colspan="2">After takeoff thrust is set, the captain’s hand must be on the thrust levers until V1.</td></tr>
<tr><td>Monitor airspeed.
Maintain light forward pressure on the control column.</td><td>Monitor airspeed and call out any abnormal indications.</td></tr>
<tr><td>Verify 80 knots and call “CHECK.”</td><td>Call “80 KNOTS.”</td></tr>
<tr><td>Verify V1 speed.</td><td>Verify the automatic V1 callout or call “V1.”</td></tr>
<tr><td>At VR, rotate toward 15° pitch attitude. After liftoff, follow F/D commands.</td><td>At VR, call “ROTATE.”
Monitor airspeed and vertical speed.</td></tr>
<tr><td>Establish a positive rate of climb.</td><td></td></tr>
<tr><td></td><td>Verify a positive rate of climb on the altimeter and call “POSITIVE RATE.”</td></tr>
<tr><td>Verify a positive rate of climb on the altimeter and call “GEAR UP.”</td><td></td></tr>
<tr><td></td><td>Set the landing gear lever to UP.</td></tr>
<tr><td>Above 400 feet radio altitude, call for a roll mode as needed.</td><td>Select or verify the roll mode.
Verify VNAV engaged.</td></tr>
<tr><td>At 800 feet AGL, verify that takeoff thrust changes to climb thrust.</td><td></td></tr>
</table>

Pilot Flying	Pilot Monitoring
At acceleration height, verify acceleration. Call "FLAPS ___" according to the flap retraction schedule.	
	Set the FLAP lever as directed.
Engage the autopilot when above the minimum altitude for autopilot engagement.	
	After flap retraction is complete: • Set or verify engine bleeds and air conditioning packs are operating [Without automatic ignition] • Set the engine start switches as needed • Set the AUTO BRAKE select switch to OFF • Set the landing gear lever to OFF after landing gear retraction is complete.
Call "AFTER TAKEOFF CHECKLIST."	
	Do the AFTER TAKEOFF checklist.

CAUTION: Do not allow the shoulder harness straps to retract quickly. Buckles can pull or damage circuit breakers.

Takeoff Flap Retraction Speed Schedule

Takeoff Flaps	At Speed (display)	Select Flaps
25	V2 + 15 “15” “5” “1”	15 5 1 UP
15 or 10	V2 + 15 “5” “1”	5 1 UP
5	V2 + 15 “1”	1 UP
1	“1”	UP
Limit bank angle to 15° until reaching V2 + 15		

Climb and Cruise Procedure

Complete the After Takeoff Checklist before starting the Climb and Cruise Procedure.

Pilot Flying	Pilot Monitoring
	During climb and cruise, verify the RNP as needed.
	At or above 10,000 feet MSL, set the LANDING light switches to OFF.
	Set the passenger signs as needed.
When climbing above transition altitude, set and crosscheck the altimeters to standard.	
	During climb, set the affected center tank fuel pump switch to OFF when a center tank fuel pump LOW PRESSURE light illuminates. Set both center tank fuel pump switches to OFF when a center tank fuel pump LOW PRESSURE light illuminates if the center tank is empty.
	When established in a level flight attitude, if the center tank contains usable fuel and a center tank fuel pump switch(es) is OFF, set the center tank fuel pump switch(es) to ON again. Set the affected center tank fuel pump switch to OFF when a center tank fuel pump LOW PRESSURE light illuminates. Set both center tank fuel pump switches to OFF when a center tank fuel pump LOW PRESSURE light illuminates if the center tank is empty.
	During an ETOPS flight, additional steps must be done. See the ETOPS supplementary procedure in SP.1.

Pilot Flying	Pilot Monitoring
	Before the top of descent, modify the active route as needed for the arrival and approach.

Climb and Cruise Procedure [AD 2002-19-52 and AD 2002-24-51]

Complete the After Takeoff Checklist before starting the Climb and Cruise Procedure.

Pilot Flying	Pilot Monitoring
	During climb and cruise, verify the RNP as needed.
	If the center tank fuel pump switches were OFF for takeoff and the center tank contains more than 1000 pounds/500 kilograms, set both center tank fuel pump switches ON above 10,000 feet or after the pitch attitude has been reduced to begin acceleration to a climb speed of 250 knots or greater.
	During climb, set both center tank fuel pump switches OFF when center tank fuel quantity reaches approximately 1000 pounds/500 kilograms.
	At or above 10,000 feet MSL, set the LANDING light switches to OFF.
	Set the passenger signs as needed.
When climbing above transition altitude, set and crosscheck the altimeters to standard.	
	When established in a level attitude at cruise, if the center tank contains more than 1000 pounds/500 kilograms and the center tank fuel pump switches are OFF, set the center tank fuel pump switches ON again. Set both center tank fuel pump switches OFF when center tank fuel quantity reaches approximately 1000 pounds/500 kilograms.

Pilot Flying	Pilot Monitoring
	During an ETOPS flight, additional steps must be done. See the ETOPS supplementary procedure in SP.1.
	Before the top of descent, modify the active route as needed for the arrival and approach.

Climb and Cruise Procedure [Alternate Method of Compliance (AMOC) to AD 2002-24-51]

Complete the After Takeoff Checklist before starting the Climb and Cruise Procedure.

Pilot Flying	Pilot Monitoring
	During climb and cruise, verify the RNP as needed.
	If the center tank fuel pump switches were OFF for takeoff and the center tank contains more than 2000 pounds/950 kilograms, set both center tank fuel pump switches ON above 10,000 feet or after the pitch attitude has been reduced to begin acceleration to a climb speed of 250 knots or greater.
	At or above 10,000 feet MSL, set the LANDING light switches to OFF.
	Set the passenger signs as needed.
When climbing above transition altitude, set and crosscheck the altimeters to standard.	
	During climb or cruise, set one center tank fuel pump switch OFF when center tank fuel quantity reaches approximately 2000 pounds/950 kilograms. Open the crossfeed valve to minimize fuel imbalance. Set the remaining center tank fuel pump switch OFF without delay and close the crossfeed valve when the Master Caution and FUEL system annunciator illuminate.
	During an ETOPS flight, additional steps must be done. See the ETOPS supplementary procedure in SP.1.

Pilot Flying	Pilot Monitoring
	Before the top of descent, modify the active route as needed for the arrival and approach.

Climb and Cruise Procedure [Alternate Method of Compliance (AMOC) to AD 2001-08-24 and AD 2002-24-51 for Airplanes with Master Caution System Logic Change and Automatic Shutoff]

Complete the After Takeoff Checklist before starting the Climb and Cruise Procedure.

<table>
<tr><th>Pilot Flying</th><th>Pilot Monitoring</th></tr>
<tr><td></td><td>During climb and cruise, verify the RNP as needed.</td></tr>
<tr><td></td><td>At or above 10,000 feet MSL, set the LANDING light switches to OFF.</td></tr>
<tr><td></td><td>Set the passenger signs as needed.</td></tr>
<tr><td colspan="2">When climbing above transition altitude, set and crosscheck the altimeters to standard.</td></tr>
<tr><td></td><td>During climb, set the affected center tank fuel pump switch to OFF when a center tank fuel pump LOW PRESSURE light illuminates.

Set both center tank fuel pump switches to OFF when a center tank fuel pump LOW PRESSURE light illuminates if the center tank is empty.</td></tr>
<tr><td></td><td>When established in a level flight attitude, if the center tank contains usable fuel and a center tank fuel pump switch(es) is OFF, set the center tank fuel pump switch(es) to ON again.

Set the affected center tank fuel pump switch to OFF when a center tank fuel pump LOW PRESSURE light illuminates.

Set both center tank fuel pump switches to OFF when a center tank fuel pump LOW PRESSURE light illuminates if the center tank is empty.</td></tr>
</table>

Pilot Flying	Pilot Monitoring
	During an ETOPS flight, additional steps must be done. See the ETOPS supplementary procedure in SP.1.
	Before the top of descent, modify the active route as needed for the arrival and approach.

Descent Procedure

Start the Descent Procedure before the airplane descends below the cruise altitude for arrival at destination.

Complete the Descent Procedure by 10,000 feet MSL.

Pilot Flying	Pilot Monitoring
	During the descent, verify the RNP as needed.
	Set the affected center tank fuel pump switch to OFF when a center tank fuel pump LOW PRESSURE light illuminates. Set both center tank fuel pump switches to OFF when a center tank fuel pump LOW PRESSURE light illuminates if the center tank is empty.

Pilot Flying	Pilot Monitoring
	If established in a level flight attitude, for an extended period of time with usable fuel in the center tank and a center tank fuel pump switch(es) is OFF, set the center tank fuel pump switch(es) to ON again. Set the affected center tank fuel pump switch to OFF when a center tank fuel pump LOW PRESSURE light illuminates. Set both center tank fuel pump switches to OFF when a center tank fuel pump LOW PRESSURE light illuminates if the center tank is empty.
	Verify that pressurization is set to landing altitude.
Review the system annunciator lights.	Recall and review the system annunciator lights.
Check landing performance	
	[Airplanes with Fail Operational Autoland capability] Verify that the autoland advisory messages are not shown.

[Not ORW]

Verify VREF on the APPROACH REF page.	Enter VREF on the APPROACH REF page.

Set the RADIO/BARO minimums as needed for the approach.	
Set or verify the navigation radios and course for the approach.	
	Set the AUTO BRAKE select switch to the needed brake setting.
Do the approach briefing.	
Call “DESCENT CHECKLIST.”	Do the DESCENT checklist.

Descent Procedure [AD 2002-19-52 and AD 2002-24-51]

Start the Descent Procedure before the airplane descends below the cruise altitude for arrival at destination.

Complete the Descent Procedure by 10,000 feet MSL.

Pilot Flying	Pilot Monitoring
	During the descent, verify the RNP as needed.
	Set both center tank fuel pump switches OFF when center tank fuel quantity reaches approximately 3000 pounds/1400 kilograms. Do not accomplish the CONFIG non-normal checklist.
	Verify that pressurization is set to landing altitude.
Review the system annunciator lights.	Recall and review the system annunciator lights.
Check landing performance	

[Not ORW]

Verify VREF on the APPROACH REF page.	Enter VREF on the APPROACH REF page.

[ORW]

Verify VREF on APPROACH REF page 1/2.	Enter VREF on APPROACH REF page 1/2.

[ORW]

Verify runway condition on APPROACH REF page 2/2.	Enter or verify runway condition on APPROACH REF page 2/2.

Set the RADIO/BARO minimums as needed for the approach.
Set or verify the navigation radios and course for the approach.

Pilot Flying	Pilot Monitoring
	Set the AUTO BRAKE select switch to the needed brake setting.
Do the approach briefing.	
Call “DESCENT CHECKLIST.”	Do the DESCENT checklist.

Descent Procedure [Alternate Method of Compliance (AMOC) to AD 2002-24-51]

Start the Descent Procedure before the airplane descends below the cruise altitude for arrival at destination.

Complete the Descent Procedure by 10,000 feet MSL.

Pilot Flying	Pilot Monitoring
	During the descent, verify the RNP as needed.
	Set one center tank fuel pump switch OFF when center tank fuel quantity reaches approximately 3000 pounds/1400 kilograms. Open the crossfeed valve to minimize fuel imbalance. Turn the remaining center tank fuel pump switch OFF without delay and close the crossfeed valve when the Master Caution and FUEL system annunciator illuminate.

Pilot Flying	Pilot Monitoring
	If established in level flight for an extended period of time prior to approach and landing with more than 2000 pounds/950 kilograms in the center tank and the center tank fuel pump switches OFF, one center tank fuel pump switch may be turned ON again. Open the crossfeed valve to minimize fuel imbalance. Turn the remaining center tank fuel pump switch OFF without delay and close the crossfeed valve when the Master Caution and FUEL system annunciator illuminate.
	Verify that pressurization is set to landing altitude.
Review the system annunciator lights.	Recall and review the system annunciator lights.
Check landing performance	

[Not ORW]

Verify VREF on the APPROACH REF page.	Enter VREF on the APPROACH REF page.

[ORW]

Verify VREF on APPROACH REF page 1/2.	Enter VREF on APPROACH REF page 1/2.

[ORW]

Verify runway condition on APPROACH REF page 2/2.	Enter or verify runway condition on APPROACH REF page 2/2.

Set the RADIO/BARO minimums as needed for the approach.	
Set or verify the navigation radios and course for the approach.	

Pilot Flying	Pilot Monitoring
	Set the AUTO BRAKE select switch to the needed brake setting.
Do the approach briefing.	
Call “DESCENT CHECKLIST.”	Do the DESCENT checklist.

Descent Procedure [Alternate Method of Compliance (AMOC) to AD 2001-08-24 and AD 2002-24-51 for Airplanes with Master Caution System Logic Change and Automatic Shutoff]

Start the Descent Procedure before the airplane descends below the cruise altitude for arrival at destination.

Complete the Descent Procedure by 10,000 feet MSL.

Pilot Flying	Pilot Monitoring
	During the descent, verify the RNP as needed.
	Set the affected center tank fuel pump switch to OFF when a center tank fuel pump LOW PRESSURE light illuminates. Set both center tank fuel pump switches to OFF when a center tank fuel pump LOW PRESSURE light illuminates if the center tank is empty.

Pilot Flying	Pilot Monitoring
	If established in a level flight attitude, for an extended period of time with usable fuel in the center tank and a center tank fuel pump switch(es) is OFF, set the center tank fuel pump switch(es) to ON again. Set the affected center tank fuel pump switch to OFF when a center tank fuel pump LOW PRESSURE light illuminates. Set both center tank fuel pump switches to OFF when a center tank fuel pump LOW PRESSURE light illuminates if the center tank is empty.
	Verify that pressurization is set to landing altitude.
Review the system annunciator lights.	Recall and review the system annunciator lights.
Check landing performance	

[Not ORW]

Verify VREF on the APPROACH REF page.	Enter VREF on the APPROACH REF page.

[ORW]

Verify VREF on APPROACH REF page 1/2.	Enter VREF on APPROACH REF page 1/2.

[ORW]

Verify runway condition on APPROACH REF page 2/2.	Enter or verify runway condition on APPROACH REF page 2/2.

Set the RADIO/BARO minimums as needed for the approach.
Set or verify the navigation radios and course for the approach.

Pilot Flying	Pilot Monitoring
	Set the AUTO BRAKE select switch to the needed brake setting.
Do the approach briefing.	
Call "DESCENT CHECKLIST."	Do the DESCENT checklist.

Approach Procedure

The Approach Procedure is normally started at transition level.

Complete the Approach Procedure before:

- the initial approach fix, or
- the start of radar vectors to the final approach course, or
- the start of a visual approach

[Option - IAN]
For an instrument approach using IAN, select the approach procedure on the ARRIVALS page. Select the G/S prompt OFF if flying an ILS approach where the G/S transmitter is inoperative or when the G/S data is unreliable. Do not manually build the approach to add waypoints to the selected FMC procedure.

When using QFE, the use of LNAV/VNAV and IAN are not authorized.

[Option - GLS]
For a GLS approach, select the appropriate GLS channel.

For an ILS, LOC, BCRS, SDF or LDA approach, select the appropriate localizer frequency.

For a BCRS approach, enter the front course in the Mode Control Panel COURSE window. Do not select VOR/LOC.

[Option -IAN]
For all other approaches, select a VOR frequency in both VHF control panels.

[FAA]
If a flaps 15 landing is needed because of performance:

[FAA]

GROUND PROXIMITY FLAP INHIBIT
switch .... FLAP INHIBIT F/O

Note: If any of the following conditions apply, set VREF ICE = VREF 15 + 10 knots:

- Engine anti–ice will be used during landing
- Wing anti–ice has been used any time during the flight
- Icing conditions were encountered during the flight and the landing temperature is below 10°C.

Note: When VREF ICE is needed, the wind additive should not exceed 5 knots.

Pilot Flying	Pilot Monitoring
	During arrival and approach, verify the RNP as needed.
	Set the passenger signs as needed.
	[Without LED Lighting System] At or above 10,000 feet MSL, set the FIXED LANDING light switches to ON. [With LED Lighting System] At or above 10,000 feet MSL, set the LANDING light switches to ON.
When descending below the transition level, set and crosscheck the altimeters.	
Update the arrival and approach, as needed.	
Update the approach briefing as needed.	
Call “APPROACH CHECKLIST.”	Do the APPROACH checklist.

Flap Extension Schedule

Current Flap Position	At Speedtape “Display”	Select Flaps	Command Speed for Selected Flaps
UP	“UP”	1	“1”
1	“1”	5	“5”
5	“5”	15	“15”
15	“15”	30 or 40	(VREF30 or VREF40) + wind additives

Landing Procedure - ILS or GLS

Pilot Flying	Pilot Monitoring

Initially
• If on radar vectors
  • HDG SEL
  • Pitch mode (as needed)
• If enroute to a fix
  • LNAV or other roll mode
  • VNAV or other pitch mode	

	[Passenger Airplanes] Notify the cabin crew to prepare for landing. Verify that the cabin is secure. [Freight Only Airplanes] Notify the supernumeraries to prepare for landing.
Call "FLAPS ___" according to the flap extension schedule.	Set the flap lever as directed. Monitor flaps and slats extension.
When on localizer intercept heading: • verify that the ILS or GLS is tuned and identified • verify that the LOC and G/S pointers are shown.	
Arm the APP mode. If a dual channel approach is desired, engage the second autopilot.	

[Option - Digital Flight Control System does not capture glideslope before localizer is captured]

Note: When using LNAV to intercept the final approach course, LNAV might parallel the localizer without capturing it.

Use LNAV or HDG SEL to intercept the final approach course as needed.	
Verify that the localizer is captured. Verify the final approach course heading.	
	Call "GLIDESLOPE ALIVE."

Pilot Flying	Pilot Monitoring
At glideslope alive, call: • "GEAR DOWN" • "FLAPS 15"	
	Set the landing gear lever to DN. Verify that the green landing gear indicator lights are illuminated. Set the flap lever to 15. [Without automatic ignition] Set the engine start switches to CONT.
Set the speed brake lever to ARM. Verify that the SPEED BRAKE ARMED light is illuminated.	
At glideslope capture, call "FLAPS ___" as needed for landing.	Set the flap lever as directed.
Set the missed approach altitude on the MCP.	
Call "LANDING CHECKLIST."	Do the LANDING checklist.
At the final approach fix (LOM, MKR, DME), verify the crossing altitude.	
Monitor the approach. [Without Fail Operational Autoland capability] If an autoland is planned, verify the AFDS status at 500 feet AGL. [Fail Operational Autoland capability] If an autoland is planned, verify the autoland status at 500 feet AGL.	
For a single channel approach, disengage the autopilot and autothrottle no later than the minimum use height for single autopilot operation. For a dual channel approach, disengage the autopilot after touchdown.	

Landing Procedure - Instrument Approach using IAN

IAN should be used only for approaches that have one of the following features:

- a published GP angle on the LEGS page for the final approach segment
- an RWxx waypoint at the approach end of the runway
- a missed approach waypoint before the approach end of the runway, (for example, MXxx)

Use of IAN is not recommended when an approach has a visual maneuver segment that is not in the FMC database.

This procedure is not authorized using QFE.

Pilot Flying	Pilot Monitoring

Initially
• If on radar vectors
  • HDG SEL
  • Pitch mode (as needed)
• If enroute to a fix
  • LNAV or other roll mode
  • VNAV or other pitch mode	

	[Passenger Airplanes] Notify the cabin crew to prepare for landing. Verify that the cabin is secure.
Call “FLAPS ___” according to the flap extension schedule.	Set the flap lever as directed. Monitor flaps and slats extension.
When on localizer/final approach course intercept heading: • verify that the navigation radios are tuned and identified (as needed) • verify that the deviation pointers are shown.	
Arm the APP mode.	
WARNING: When using LNAV to intercept the localizer, LNAV might parallel the localizer without capturing it. The airplane can then descend on the glide path with the localizer not captured.	
Use LNAV or HDG SEL to intercept the final approach course as needed.	
Verify that the localizer/final approach course is captured. Verify final approach course heading.	

Pilot Flying	Pilot Monitoring
	Approximately 2 NM before the final approach fix, call "APPROACHING GLIDE PATH."
Approximately 2 NM before the final approach fix, call: • "GEAR DOWN" • "FLAPS 15"	
	Set the landing gear lever to DN. Verify that the green landing gear indicator lights are illuminated. Set the flap lever to 15. [Without automatic ignition] Set the engine start switches to CONT.
Set the speed brake lever to ARM. Verify that the SPEED BRAKE ARMED light is illuminated.	
At glide path capture, call "FLAPS ___" as needed for landing.	Set the flap lever as directed.
Set the missed approach altitude on the MCP.	
Call "LANDING CHECKLIST."	Do the LANDING checklist.
At the final approach fix: • verify the crossing altitude • crosscheck the altimeters. Verify they agree within 100 feet.	
Monitor the approach.	
If suitable visual reference is established at MDA(H), DA(H), or the missed approach point, disengage the autopilot in accordance with regulatory requirements, and disengage the autothrottle at the same time. Maintain the glide path to landing.	

Landing Procedure - Instrument Approach using VNAV

[With VNAV ALT enabled]

VNAV should be used only for approaches that have one of the following features:

- a published GP angle on the LEGS page for the final approach segment
- an RWxx waypoint at the approach end of the runway
- a missed approach waypoint before the approach end of the runway, (for example, MXxx).

This procedure is not authorized using QFE.

Pilot Flying	Pilot Monitoring

Initially
• If on radar vectors
  • HDG SEL
  • Pitch mode (as needed)
• If enroute to a fix
  • LNAV or other roll mode
  • VNAV or other pitch mode	

	[Passenger Airplanes] Notify the cabin crew to prepare for landing. Verify that the cabin is secure.
Call “FLAPS ___” according to the flap extension schedule.	Set the flap lever as directed. Monitor flaps and slats extension.
The recommended roll modes for the final approach are: • for an RNAV or GPS approach use LNAV • for a LOC-BC, VOR or NDB approach use LNAV • for a LOC, SDF or LDA approach use LNAV or VOR/LOC.	
When on the final approach course intercept heading for LOC, LOC-BC, SDF or LDA approaches: • verify that the localizer is tuned and identified [With NPS scales] • verify that the anticipation cue or LOC pointer is shown [Without NPS scales] • verify that the LOC pointer is shown.	
Select LNAV or arm the VOR/LOC mode.	

<table>
<tr><th>Pilot Flying</th><th>Pilot Monitoring</th></tr>
<tr><td colspan="2">WARNING: When using LNAV to intercept the localizer, LNAV might parallel the localizer without capturing it. The airplane can then descend on the VNAV path with the localizer not captured.</td></tr>
<tr><td>Use LNAV or HDG SEL to intercept the final approach course as needed.</td><td></td></tr>
<tr><td colspan="2">Verify that LNAV is engaged or that VOR/LOC is captured.</td></tr>
<tr><td>Approximately 2 NM before the final approach fix and after ALT HOLD or VNAV PTH or VNAV ALT is annunciated:
• set DA(H) or MDA(H) on the MCP
• select or verify VNAV
[Option - Speed and altitude intervention]
• select or verify speed intervention, (as needed).</td><td>Approximately 2 NM before the final approach fix, call “APPROACHING GLIDE PATH.”</td></tr>
<tr><td>Call:
• “GEAR DOWN”
• “FLAPS 15.”</td><td></td></tr>
<tr><td></td><td>Set the landing gear lever to DN.
Verify that the green landing gear indicator lights are illuminated.
Set the flap lever to 15.
[Without automatic ignition]
Set the engine start switches to CONT.</td></tr>
<tr><td>Set the speed brake lever to ARM.
Verify that the SPEED BRAKE ARMED light is illuminated.</td><td></td></tr>
<tr><td>Beginning the final approach descent, call “FLAPS ___” as needed for landing.</td><td>Set the flap lever as directed.</td></tr>
<tr><td>Call “LANDING CHECKLIST.”</td><td>Do the LANDING checklist.</td></tr>
</table>

Pilot Flying	Pilot Monitoring
At the final approach fix: • verify the crossing altitude • crosscheck the altimeters. Verify they agree within 100 feet.	
Monitor the approach.	
When at least 300 feet below the missed approach altitude, set the missed approach altitude on the MCP.	
If suitable visual reference is established at DA(H), MDA(H) or the missed approach point, disengage the autopilot in accordance with regulatory requirements, and disengage the autothrottle at the same time. Maintain the glide path to landing.	

Landing Procedure - Instrument Approach using VNAV

[Without VNAV ALT enabled]

VNAV should be used only for approaches that have one of the following features:

- a published GP angle on the LEGS page for the final approach segment
- an RWxx waypoint at the approach end of the runway
- a missed approach waypoint before the approach end of the runway, (for example, MXxx).

This procedure is not authorized using QFE.

Pilot Flying	Pilot Monitoring

Initially
• If on radar vectors
  • HDG SEL
  • Pitch mode (as needed)
• If enroute to a fix

Verify that the green landing gear indicator lights are illuminated.
Set the flap lever to 15.
[Without automatic ignition]
Set the engine start switches to CONT.</td></tr>
</table>

Pilot Flying	Pilot Monitoring
Set the speed brake lever to ARM. Verify that the SPEED BRAKE ARMED light is illuminated.	
Beginning the final approach descent, call “FLAPS ___” as needed for landing.	Set the flap lever as directed.
Call “LANDING CHECKLIST.”	Do the LANDING checklist.
At the final approach fix: • verify the crossing altitude • crosscheck the altimeters. Verify they agree within 100 feet.	
Monitor the approach.	
When at least 300 feet below the missed approach altitude, set the missed approach altitude on the MCP.	
If suitable visual reference is established at DA(H), MDA(H) or the missed approach point, disengage the autopilot in accordance with regulatory requirements, and disengage the autothrottle at the same time. Maintain the glide path to landing.	

Go–Around and Missed Approach Procedure

Pilot Flying	Pilot Monitoring
Push the TO/GA switch.	
Verify that the thrust increases.	
Call "FLAPS 15" or "FLAPS ___" as needed.	Set the flap lever as directed and monitor flap retraction.
Verify the rotation to go-around attitude.	
	Verify that the thrust is sufficient for the go-around or adjust as needed.
Verify a positive rate of climb on the altimeter and call “GEAR UP.”	Verify a positive rate of climb on the altimeter and call “POSITIVE RATE.” Set the landing gear lever to UP.
	Verify that the missed approach altitude is set.
If the airspeed is within the amber band, limit bank angle to 15°.	
[Option - Airplanes with TO/GA to LNAV feature] Above 400 feet radio altitude, verify LNAV or select HDG SEL as appropriate. [Option - Airplanes without TO/GA to LNAV feature] Above 400 feet radio altitude, select appropriate roll mode and verify proper mode annunciation.	Observe mode annunciation.
Verify that the missed approach route is tracked.	
At acceleration height, call “FLAPS ___” according to the flap retraction schedule.	Set the FLAP lever as directed. Monitor flaps and slats retraction.

Pilot Flying	Pilot Monitoring

[Option -- FMC U10.7 and later]

After flaps are set to the planned flap setting and at or above the flap maneuvering speed, select LVL CHG or VNAV.	

Verify that climb thrust is set.	
Verify that the missed approach altitude is captured.	
	Set the landing gear lever to OFF after landing gear retraction is complete. [Without automatic ignition] Set the engine start switches as needed.
Call “AFTER TAKEOFF CHECKLIST.”	Do the AFTER TAKEOFF checklist.

Landing Roll Procedure

[Option - Electronic Flight Bag]

Pilot Flying	Pilot Monitoring
If an autoland was accomplished, disengage the autopilot. Control the airplane manually.	
Verify that the thrust levers are closed. Verify that the SPEED BRAKE lever is UP. Without delay, fly the nose wheel smoothly onto the runway.	Verify that the SPEED BRAKE lever is UP. Call “SPEED BRAKES UP.” If the SPEED BRAKE lever is not UP, call “SPEED BRAKES NOT UP.”
Monitor the rollout progress.	
Verify correct autobrake operation.	
WARNING: After the reverse thrust levers are moved, only a full stop landing can be made. If an engine stays in reverse, safe flight is not possible.	
Without delay, move the reverse thrust levers to the interlocks and hold light pressure until the interlocks release. Apply reverse thrust as needed.	Verify that the forward thrust levers are closed. When both REV indications are green, call "REVERSERS NORMAL". If there is no REV indication(s) or the indication(s) stays amber, call "NO REVERSER ENGINE NUMBER 1", or "NO REVERSER ENGINE NUMBER 2", or "NO REVERSERS".
By 60 knots, start movement of the reverse thrust levers to be at the reverse idle detent before taxi speed.	Call “60 KNOTS.”
After the engines are at reverse idle, move the reverse thrust levers full down.	
Before taxi speed, disarm the autobrake. Use manual braking as needed.	

Pilot Flying	Pilot Monitoring
CAUTION: Do not use the Airport Map application as a primary navigation reference. The Airport Map application is designed to aid flight crew positional awareness only.	

Landing Roll Procedure - Airplanes with Fail Operational Autoland Capability

[Option - Electronic Flight Bag]

Pilot Flying	Pilot Monitoring
Verify that the thrust levers are closed. Verify that the SPEED BRAKE lever is UP.	Verify that the SPEED BRAKE lever is UP. Call “SPEED BRAKES UP.” If the SPEED BRAKE lever is not UP, call “SPEED BRAKES NOT UP.”
Monitor the rollout progress.	
Verify correct autobrake operation.	
WARNING: After the reverse thrust levers are moved, only a full stop landing can be made. If an engine stays in reverse, safe flight is not possible.	
Without delay, move the reverse thrust levers to the interlocks and hold light pressure until the interlocks release. Apply reverse thrust as needed.	Verify that the forward thrust levers are closed. When both REV indications are green, call "REVERSERS NORMAL". If there is no REV indication(s) or the indication(s) stays amber, call "NO REVERSER ENGINE NUMBER 1", or "NO REVERSER ENGINE NUMBER 2", or "NO REVERSERS".
By 60 knots, start movement of the reverse thrust levers to be at the reverse idle detent before taxi speed.	Call “60 KNOTS.”
After the engines are at reverse idle, move the reverse thrust levers full down.	

Pilot Flying	Pilot Monitoring
Before taxi speed, disarm the autobrake. Use manual braking as needed.	
If an autoland was accomplished, disengage the autopilot before turning off the runway.	

CAUTION: Do not use the Airport Map application as a primary navigation reference. The Airport Map application is designed to aid flight crew positional awareness only.

After Landing Procedure

[Without automatic ignition]

Start the After Landing Procedure when clear of the active runway.

Engine cooldown recommendations:

- run the engines for at least 3 minutes
- use a thrust setting normally used for taxi operations
- routine cooldown times less than 3 minutes are not recommended.

Pilot Flying	Pilot Monitoring
The captain moves or verifies that the SPEED BRAKE lever is DOWN.	
	Start the APU, as needed.
	[With automatic probe heat] Set the PROBE HEAT switches to AUTO. [Without automatic probe heat] Set the PROBE HEAT switches to OFF.
	Set the exterior lights as needed.
	Set the ENGINE START switches to OFF.
Set the weather radar to OFF.	
	Set the AUTO BRAKE select switch to OFF.
	Set the flap lever to UP.
	Set the transponder as needed.

After Landing Procedure

[With automatic ignition]

Start the After Landing Procedure when clear of the active runway.

Engine cooldown recommendations:

- run the engines for at least 3 minutes
- use a thrust setting normally used for taxi operations
- routine cooldown times less than 3 minutes are not recommended.

Pilot Flying	Pilot Monitoring
The captain moves or verifies that the SPEED BRAKE lever is DOWN.	
	Start the APU, as needed.
	[With automatic probe heat] Set the PROBE HEAT switches to AUTO. [Without automatic probe heat] Set the PROBE HEAT switches to OFF.
	Set the exterior lights as needed.
Set the weather radar to OFF.	
	Set the AUTO BRAKE select switch to OFF.
	Set the flap lever to UP.
	Set the transponder as needed.

Shutdown Procedure

Start the Shutdown Procedure after taxi is complete.

Parking brake .... Set C or F/O

Verify that the parking brake warning light is illuminated.

Electrical power .... Set F/O

If APU power is needed:

Verify that the APU GENERATOR OFF BUS light is illuminated.

APU GENERATOR bus switches – ON

Verify that the SOURCE OFF lights are extinguished.

If external power is needed:

Verify that the GRD POWER AVAILABLE light is illuminated.

GRD POWER switch – ON

Verify that the SOURCE OFF lights are extinguished.

[Option - New Engine Start levers]

CAUTION: Do not apply rotational force when moving the engine start lever.

Engine start levers ....CUTOFF C

Operate the engines at or near idle thrust for a minimum of three minutes before shutdown to thermally stabilize the engines and reduce undercowl soak-back temperatures. Taxi thrust can be considered idle thrust for this purpose.

If idle reverse thrust or no reverse thrust is used during the landing rollout, the three minute period can begin when thrust is reduced to idle for landing.

Routine cooldown times of less than three minutes before engine shutdown can cause engine degradation.

If towing is needed:

Establish communications with ground handling personnel C

WARNING: If the nose gear steering lockout pin is not installed and hydraulic system A is pressurized, any change to electrical or hydraulic power with the tow bar connected can cause unwanted tow bar movement.

Verify that the nose gear steering lockout pin is installed, or, if the nose gear steering lockout pin is not used C

System A HYDRAULIC PUMP switches – OFF

Verify that the system A pump LOW PRESSURE lights are illuminated.

CAUTION: Do not hold or turn the nose wheel steering wheel during pushback or towing. This can damage the nose gear or the tow bar.

CAUTION: Do not use airplane brakes to stop the airplane during pushback or towing. This can damage the nose gear or the tow bar.

Set or release the parking brake as directed by ground handling personnel.		C or F/O
FASTEN BELTS switch	OFF	F/O
ANTI COLLISION light switch	OFF	F/O
FUEL PUMP switches	OFF	F/O
[Option] CAB/UTIL power switch	As needed	F/O
[Option] IFE/PASS SEAT power switch	As needed	F/O
WING ANTI–ICE switch	OFF	F/O
ENGINE ANTI–ICE switches	OFF	F/O
Hydraulic panel	Set	F/O
ENGINE HYDRAULIC PUMPS switches - ON		
ELECTRIC HYDRAULIC PUMPS switches - OFF		
Air conditioning PACK switches	AUTO	F/O
ISOLATION VALVE switch	OPEN	F/O
Engine BLEED air switches	ON	F/O
APU BLEED air switch	ON	F/O
Exterior lights switches	As needed	F/O
FLIGHT DIRECTOR switches	OFF	C, F/O
Transponder mode selector	STBY	F/O
[Option - Electronic Flight Bag] EFB CLOSE FLIGHT	Select	C, F/O
After the wheel chocks are in place:		
Parking brake – Release		C or F/O
APU switch	As needed	F/O

Note: If extended APU operation is needed on the ground and the airplane busses are powered by AC electrical power, position an AC powered fuel pump ON. This extends the service life of the APU fuel control unit.

Note: If fuel is loaded in the center tank, position the left center tank fuel pump switch ON to prevent a fuel imbalance before takeoff.

CAUTION: Position the center tank fuel pump switches ON only if the fuel quantity in the center tank exceeds 453kgs/1000 lbs.

CAUTION: Do not operate the center tank fuel pumps with the flight deck unattended.

Call “SHUTDOWN CHECKLIST.”	C
Do the SHUTDOWN checklist.	F/O

Secure Procedure

IRS mode selectors	OFF	F/O
EMERGENCY EXIT LIGHTS switch	OFF	F/O
WINDOW HEAT switches	OFF	F/O
Air conditioning PACK switches	OFF	F/O
[Option - Electronic Flight Bag] EFB POWER switch	Push	C, F/O
Call “SECURE CHECKLIST.”		C
Do the SECURE checklist.		F/O

Blank

Supplementary Procedures — Chapter SP
Table of Contents — Section TOC

General

This section contains procedures (adverse weather operation, engine crossbleed start, and so on) that are accomplished as required rather than routinely performed on each flight.

Supplementary procedures may be required because of adverse weather, unscheduled maintenance or as a result of a procedure referenced in a Non–Normal Checklist. Additionally, some may be performed if the flight crew must accomplish preflight actions normally performed by maintenance personnel.

At the discretion of the Captain, procedures may be performed by memory, by reviewing the procedure prior to accomplishment, or by reference to the procedure during its accomplishment.

Supplementary procedures are provided by section. Section titles correspond to the respective chapter title for the system being addressed except for the adverse weather section.

Intentionally
Blank

Interior Inspection

Emergency exit lights .... Check

Passenger signs .... Check

Service and entry doors .... Check

Escape slides .... Check pressure

Emergency exits .... Check

Wing upper surfaces .... Check

Lavatory fire extinguishers .... Check

Emergency equipment .... Check

Check availability and condition of emergency equipment, as required.

Flight Deck Door Access System Test

Flight Deck Access System switch ....NORM

Flight deck door .... Open

Flight deck door lock selector...AUTO

Emergency access code .... Enter

ENT key ....Push

Verify alert sounds.

Verify AUTO UNLK light illuminates.

Flight deck door lock selector.. DENY

Verify AUTO UNLK light extinguishes.

Flight deck door lock selector...UNLKD

Flight deck access system switch .... OFF

Verify LOCK FAIL light illuminates.

Flight deck access system switch .... NORM

Guard - Down

Verify LOCK FAIL light extinguishes.

Water System Draining

Lavatory water supply selector valves .... SUPPLY/DRAIN

Galley water supply shutoff valves .... SUPPLY ON

The shutoff valve is found adjacent to each wet galley sink.

Drain line ....Connect to drain ports

There are two drain port locations:

- below the forward entry door
- aft of the water service panel

Water service panel ....Open

Tank drain valve handle ....OPEN

Drains potable water tank and water system aft of the wings.

Forward lavatory drain valve ....OPEN

Drain valve is found below the sink in the forward lavatory only.

Drain valves for coffee maker and
water boiler (if installed) ....OPEN

All galley and lavatory water faucets ....Open

Close faucets when water flow stops.

Accomplish the following items after verifying the potable water system is empty:

Drain valves for coffee maker and
water boiler (if installed) .... CLOSED

Forward lavatory drain valve .... CLOSED

Tank drain valve handle .... CLOSED

Water service panel ....Close

Drain line ....Disconnect from drain ports

If the potable water tank will not be refilled immediately after the system is emptied, open the following circuit breakers and attach DO–NOT–CLOSE tags:

P18–3 circuit breaker panel

- LAVATORY WATER HEATER A
- LAVATORY WATER HEATER D
- LAVATORY WATER HEATER E

Power distribution panel number 1

- POT WATER COMPRESSOR
- WATER QTY IND

Forward Airstair Operation

[Option]

WARNING: Use care not to fall from the airstair platform when operating the forward entry door. The small platform area and bad weather can make the door difficult to operate.

CAUTION: Operation of airstair in winds exceeding 40 knots is not recommended.

CAUTION: Do not move airplane with stair extended.

Interior Control

WARNING: Open entry door to cocked position to allow clear visibility of area outside airplane to prevent injury to personnel. Do not open door beyond cocked position while operating airstair.

To extend:

Forward entry door ....Open to cocked position

When operating the airstair from the interior control panel, the forward entry door must be open to the cocked position. Safety circuits prevent airstair operation if the entry door is closed.

Control switch ....EXTEND

Note: For interior standby operation, the battery switch must be ON.

Hold until extension is complete.

The STAIRS OPER light illuminates during extension until the airstair is fully extended.

Note: The STAIRS OPER light will not illuminate with loss of AC power.

Control switch .... Release

Handrail extensions ....Engage

Release latch and pull inboard and up, extend and engage on the supports at the sides of the forward entry doorway.

To Retract:

Handrail extensions .... Disengage

Disengage from door supports, depress latch at base of forward extension to permit retraction within upper segment of handrail. Slide right and left extensions down along upper rails. Stowing in appropriate stowage points provides circuit continuity for energizing retract relay.

CAUTION: Use of the standby control switch bypasses all safety circuits. Airstair handrail extensions must be stowed or substantial damage could result.

Control switch .... RETRACT

Hold until retraction is complete.

The STAIRS OPER light illuminates during retraction until the airstair door is fully closed.

Note: The STAIRS OPER light will not illuminate with loss of AC power.

Control switch .... Release

Exterior Control

To Extend:

Normal mode:

AIRSTAIRS switch .... EXTEND

Standby mode:

POWER switch .... Hold in STANDBY

AIRSTAIRS switch .... EXTEND

Forward entry door .... Open to cocked position

WARNING: Extend and connect the airstair aft handrail to protect against falling and prevent injuries to personnel.

Aft handrail extension .... Engage

Release latch and pull inboard and up, extend and engage on the support at the side of the forward entry door.

WARNING: Step down the airstair as the forward entry door moves to the open position to prevent injuries to personnel.

Forward entry door ....Fully open

Forward handrail extension ....Engage

Release latch and pull inboard and up, extend and engage on the support at the side of the forward entry door.

To Retract:

WARNING: Do not disengage the airstair aft handrail at this time. Injuries to personnel can occur during forward entry door operations if the aft handrail is disengaged.

Forward handrail extension ....Disengage

Disengage from door support, depress latch at base of forward extension to permit retraction within upper segment of handrail. Slide right and left extensions down along upper rails. Stowing in appropriate stowage points provides circuit continuity for energizing retract relay.

WARNING: Step down the airstair as the forward entry door moves to the cocked position to prevent injuries to personnel.

Forward entry door .... Close to cocked position

Aft handrail extension ....Disengage

Disengage from door support, depress latch at base of forward extension to permit retraction within upper segment of handrail. Slide right and left extensions down along upper rails. Stowing in appropriate stowage points provides circuit continuity for energizing retract relay.

Forward entry door .... Fully close

CAUTION: Use of the standby control switch bypasses all safety circuits. Airstair handrail extension must be stowed or substantial damage could result.

Normal mode:

AIRSTAIRS switch ....RETRACT

Standby mode:

POWER switch .... Hold in STANDBY

AIRSTAIRS switch ....RETRACT

Main Deck Cargo Door Operation

Normal Operation

Normal operation requires electrical power and hydraulic pressure from system A.

CAUTION: Do not operate with winds in excess of 40 knots. Do not keep the door in the open position with winds in excess of 60 knots. Strong winds can cause damage to the structure of the airplane.

CAUTION: Verify all personnel and equipment are clear of door path.

Unlock Main Cargo Door

Verify the following lights are illuminated:

- CLOSED & LATCHED
- LOCKED

Verify the following lights are extinguished:

- OPENED
- IN TRANSIT
- READY TO OPEN
- UNLOCKED

UNLOCK or LOCK switch ....Hold to UNLOCK until the READY TO OPEN light illuminates

The LOCKED light extinguishes and the UNLOCKED light illuminates.

Open to Canopy Position

Simultaneously hold the following switches until the OPENED light illuminates:

ARM switch ....Hold up to ARM

UP TO CANOPY or CLOSE switch .... Hold to UP TO CANOPY

READY TO OPEN and CLOSED & LATCHED lights extinguish and IN TRANSIT light illuminates.

IN TRANSIT light extinguishes when the OPENED light illuminates.

Open to Full Open Position

Simultaneously hold the following switches until the door stops moving, indicating it is in the full open position:

ARM switch .... Hold up to ARM

FULL OPEN or
DOWN to CANOPY switch .... Hold to FULL OPEN

OPENED and UNLOCKED lights stay illuminated.

Lower to Canopy Position

Simultaneously hold the following switches until the door stops moving, indicating it is in the canopy position:

ARM switch .... Hold down to ARM

FULL OPEN or
DOWN to CANOPY switch .... Hold to DOWN TO CANOPY

OPENED and UNLOCKED lights stay illuminated.

Close from Canopy Position

Simultaneously hold the following switches until the CLOSED & LATCHED light illuminates.

ARM switch .... Hold down to ARM

UP TO CANOPY or CLOSE switch .... Hold to CLOSE

OPENED light extinguishes and IN TRANSIT light illuminates.

Door is closed when the IN TRANSIT light extinguishes, and the CLOSED & LATCHED and READY TO OPEN lights illuminate.

Lock Main Cargo Door

UNLOCK or LOCK switch .... Hold to LOCK until the LOCKED light illuminates

The READY TO OPEN and UNLOCKED lights extinguish and the LOCKED light illuminates.

Verify the following lights are illuminated:
- CLOSED & LATCHED
- LOCKED

Verify the following lights are extinguished:
- OPENED
- IN TRANSIT
- READY TO OPEN
- UNLOCKED

Oxygen Mask Microphone Test

[Without Mask/Boom switch]

FLT INT switch .... Push

SPKR switch .... On

TEST/RESET switch .... Push and hold

EMERGENCY/Test selector .... Push and hold

Push-to-Talk switch .... I/C

Simultaneously push the Push-to-Talk switch, the EMERGENCY/Test selector and the TEST/RESET switch.

Verify oxygen flow sound is heard through the flight deck speaker.

Push-to-Talk switch .... Release

EMERGENCY/Test selector .... Release

TEST/RESET switch .... Release

SPKR switch .... As needed

Oxygen Mask Microphone Test

[With Mask/Boom switch]

MASK/BOOM switch .... MASK

FLT INT switch .... Push

SPKR switch .... On

RESET/TEST switch .... Push and hold

EMERGENCY/Test selector .... Push and hold

Push-to-Talk switch .... INT

Simultaneously push the Push-to-Talk switch, the EMERGENCY/Test selector and the RESET/TEST switch.

Verify oxygen flow sound is heard through the flight deck speaker.

Push-to-Talk switch .... Release

EMERGENCY/Test selector .... Release

RESET/TEST switch .... Release

SPKR switch .... As needed

MASK/BOOM switch .... BOOM

ETOPS

Operators conducting ETOPS are required to comply with appropriate regulations. An operator must have an ETOPS configured and approved airplane, and approved flight operations and maintenance programs in place to support ETOPS.

APU Operation

Unless otherwise authorized, start the APU before the ETOPS segment. The APU must be on for the entire ETOPS segment.

Fuel Crossfeed Valve Check

Unless accomplished by maintenance personnel prior to the ETOPS flight, do the following steps on the ground prior to engine start:

Crossfeed selector .... Open

Verify that the VALVE OPEN light illuminates bright, then dim.

Crossfeed selector .... Close

Verify that the VALVE OPEN light illuminates bright, then extinguishes.

During the last hour of cruise, do the following steps:

Crossfeed selector ....Open

Verify that the VALVE OPEN light illuminates bright, then dim.

Crossfeed selector .... Close

Verify that the VALVE OPEN light illuminates bright, then extinguishes.

Intentionally
Blank

Wing–Body Overheat Test

Wing–body OVHT TEST switch .... Push

Hold for a minimum of 5 seconds.

Both WING–BODY OVERHEAT lights – illuminated

MASTER CAUTION – illuminated

AIR COND system annunciator – illuminated

Wing–body OVHT TEST switch .... Release

Both WING–BODY OVERHEAT lights – extinguished

MASTER CAUTION lights – extinguished

AIR COND system annunciator – extinguished

External Air Cart Use

CAUTION: The BAT switch should always be on when using the airplane air conditioning system since the protective circuits are DC. This ensures protection in the event of loss of AC power.

Note: For engine start with a ground air source, see section SP.7.

APU BLEED air switch .... OFF

ISOLATION VALVE switch .... OPEN

[737-600/700]
RECIRC FAN switch .... AUTO

[737-800/900]
RECIRC FAN switches .... AUTO

[737-800/900]
Trim Air Switch .... ON

PACK switches .... AUTO or HIGH

Cabin temperature selectors .... AUTO

Set for desired temperature.

Duct pressure .... 20 psi minimum

If external air cannot hold 20 psi minimum and the APU is operating:

ISOLATION VALVE switch .... AUTO

APU BLEED air switch .... ON

APU supplies left pack and external air source supplies right pack.

Ground Conditioned Air Use

Before connecting ground conditioned air:

PACK switches ....OFF

Packs can be damaged if they are operated while ground conditioned air is connected.

After disconnecting ground conditioned air:

PACK switches .... As needed

Isolated Pack Operation during Engine Start

To improve cabin air quality between starting the first and second engine:

CAUTION: Moving engine BLEED air switches while a starter is engaged can damage the starter.

Engine No. 2 ....Start

After engine No. 2 stabilized:

ISOLATION VALVE switch .... CLOSE

Right PACK switch .... AUTO

Duct pressure .... Stabilized

Engine No. 1 ....Start

After engine No. 1 stabilized:

ISOLATION VALVE switch .... AUTO

Pressurization System Manual Mode Test

PACK switches ....OFF

Pressurization mode selector .... MAN

AUTO FAIL and ALTN lights – extinguished.

MANUAL light – illuminated.

Outflow valve switch .... CLOSE

Verify outflow valve position indicator moves toward CLOSE.

Outflow valve switch .... OPEN

Verify outflow valve position indicator moves toward OPEN.

Pressurization mode selector ....AUTO

Verify outflow valve position indicator moves toward OPEN.

MANUAL light – extinguished.

Manual Mode Operation

CAUTION: Switch actuation to the manual mode causes an immediate response by the outflow valve. Full range of motion of the outflow valve can take up to 20 seconds.

Pressurization mode selector .... MAN

MANUAL light – illuminated

CABIN/FLIGHT ALTITUDE placard.. Check

Determine the desired cabin altitude.

If a higher cabin altitude is desired:

Outflow valve switch (momentarily) ....OPEN

Verify the outflow valve position indicator moves right, cabin altitude climbs at the desired rate, and differential pressure decreases. Repeat as necessary.

If a lower cabin altitude is desired:

Outflow valve switch (momentarily) ....CLOSE

Verify the outflow valve position indicator moves left, cabin altitude descends at the desired rate, and differential pressure increases. Repeat as necessary.

During Descent

Thrust lever changes should be made as slowly as possible to prevent excessive pressure bumps.

Outflow valve switch (momentarily) .... CLOSE

During descent, intermittently position the outflow valve switch toward CLOSE, observing cabin altitude decrease as the airplane descends.

Before entering the landing pattern, slowly position the outflow valve to full open to depressurize the airplane. Verify differential pressure is zero.

Pressurization Control Operation – Landing at Alternate Airport

At top of descent:

LAND ALT Indicator .... Reset

Reset to new destination field elevation.

Automatic Pressurization Control – Departure Airport Elevation Above 8400 Feet

[Option - High Altitude Landing option (maximum Takeoff and Landing Altitude above 8400 feet) with High Altitude Landing switch]

If departure airport elevation is above 10,000 feet:

Oxygen masks and regulators .... ON, Normal

Supplemental oxygen must be used from departure until the cabin altitude is below 10,000 feet.

After electrical power is applied to the airplane:

HIGH ALT LDG switch .... Off

Monitor CABIN ALT and CABIN rate of CLIMB indicators during climbout to ensure cabin altitude is descending below 8500 feet, at which time the cabin altitude warning system is reset to 10,000 feet.

If landing altitude is at or below 6000 feet:

LAND ALT indicator .... Destination field elevation

If landing altitude is above 6000 feet:

Do the Automatic Pressurization Control - Landing Airport Elevation Above 6000 Feet supplementary procedure.

Return to Departure Airport is Needed

HIGH ALT LDG switch .... ON

If landing elevation is above 10,000 feet:

Oxygen masks and regulators .... ON, Normal

Supplemental oxygen must be used anytime the cabin altitude is above 10,000 feet.

Automatic Pressurization Control – Landing Airport Elevation Above 6000 Feet but 8400 Feet and Below

[All Airplanes]

Do the normal Preflight Procedure - First Officer except as modified below.

Prior to takeoff:

LAND ALT indicator .... 6000 feet

At initial descent:

LAND ALT indicator .... Destination field elevation

Automatic Pressurization Control – Landing Airport Elevation Above 8400 Feet

[Option - High Altitude Landing option (maximum Takeoff and Landing Altitude above 8400 feet) with High Altitude Landing switch]

Do the normal Preflight Procedure - First Officer except as modified below.

Prior to takeoff:

LAND ALT indicator .... 6000 feet

[Normal Cabin Altitude]

At initial descent or approximately 20 minutes prior to landing:

If landing elevation is above 8400 feet:

HIGH ALT LDG switch .... ON

If landing elevation is above 10,000 feet:

Oxygen masks and regulators .... ON, Normal

Supplemental oxygen must be used anytime the cabin altitude is above 10,000 feet.

LAND ALT indicator .... Destination field elevation

[Option - Low Cabin Altitude]

At initial descent or approximately 25 minutes prior to landing:

If landing elevation is above 8400 feet:

HIGH ALT LDG switch .... ON

If landing elevation is above 10,000 feet:

Oxygen masks and regulators .... ON, Normal

Supplemental oxygen must be used anytime the cabin altitude is above 10,000 feet.

LAND ALT indicator .... Destination field elevation

Unpressurized Takeoff and Landing

When making a no engine bleed takeoff or landing with the APU inoperative, or operative but not providing bleed air:

Takeoff

PACK switches .... AUTO

ISOLATION VALVE switch .... CLOSE

Engine BLEED air switches .... OFF

APU BLEED air switch .... OFF

After Takeoff

Note: If engine failure occurs, do not position engine BLEED air switches ON until reaching 1500 feet or until obstacle clearance height has been attained.

At not less than 400 feet, and prior to 2000 feet above field elevation:

Engine No. 2 BLEED air switch .... ON

When CABIN rate of CLIMB indicator stabilizes:

Engine No. 1 BLEED air switch ....ON

ISOLATION VALVE switch .... AUTO

Landing

When below 10,000 feet and starting the turn to final approach:

Engine BLEED air switches .... OFF

[Passenger Airplanes]
Avoid high rates of descent for passenger comfort.

[Freight Only Airplanes]
Avoid high rates of descent for supernumerary comfort.

No Engine Bleed Takeoff and Landing

When making a no engine bleed takeoff or landing with the APU operating.

Takeoff

Note: If anti–ice is required for taxi, configure for a “No Engine Bleed Takeoff” just prior to takeoff.

Note: If anti–ice is not required for taxi, configure for a “No Engine Bleed Takeoff” just after engine start.

Right PACK switch ....AUTO

ISOLATION VALVE switch .... CLOSE

Left PACK switch ....AUTO

Engine No. 1 BLEED air switch .... OFF

APU BLEED air switch ....ON

Engine No. 2 BLEED air switch .... OFF

[737-800/-900]
Trim Air Switch ....ON

WING ANTI-ICE switch .... OFF

The WING ANTI-ICE switch must remain OFF until the engine BLEED air switches are repositioned to ON and the ISOLATION VALVE switch is repositioned to AUTO.

After Takeoff

Note: If engine failure occurs, do not position engine BLEED air switches ON until reaching 1500 feet or until obstacle clearance height has been attained.

Engine No. 2 BLEED air switch .... ON

APU BLEED air switch ....OFF

When CABIN rate of CLIMB indicator stabilizes:

Engine No. 1 BLEED air switch .... ON

ISOLATION VALVE switch...AUTO

Landing

If additional go–around thrust is desired, configure for a "No Engine Bleed Landing."

When below 10,000 feet:

WING ANTI-ICE switch ....OFF

Right PACK switch ....AUTO

ISOLATION VALVE switch .... CLOSE

Left PACK switch ....AUTO

Engine No. 1 BLEED air switch ....OFF

APU BLEED air switch .... ON

Engine No. 2 BLEED air switch ....OFF

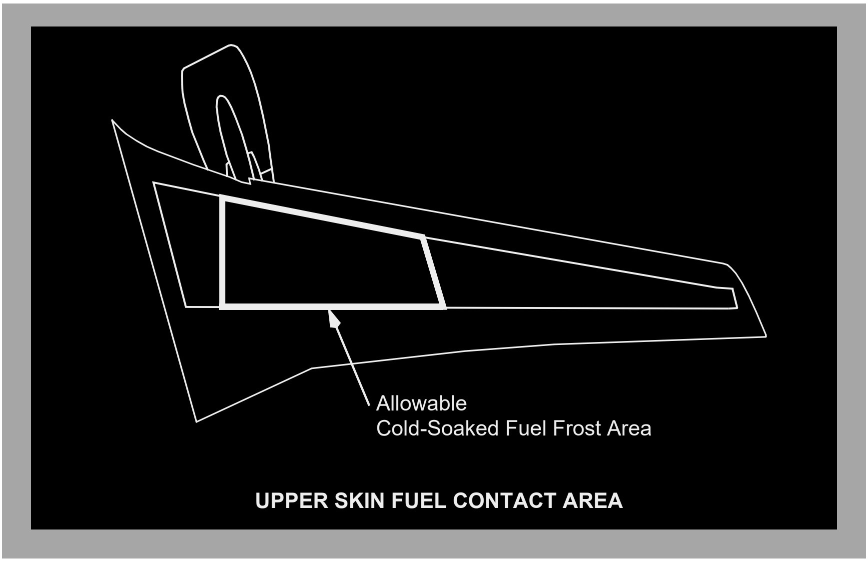
Anti–Ice Operation

Requirements for use of anti–ice and operational procedures for engine and wing anti–ice are contained in Supplementary Procedures, Adverse Weather Section SP.16.

Cold-Soaked Fuel Frost (CSFF)

Frost may form on the lower and upper wing surfaces due to cold-soaked fuel touching the wing surface after long flights with large fuel loads.

Exterior Safety Inspection - Airplanes with Defined Cold-Soaked Fuel Frost Area



Note: The presence of the painted cold soaked fuel frost area on the upper wing and the inclusion of these procedures in the FCOM do not constitute operational approval. Operators may be allowed to use these procedures by referring to the appropriate regulatory authority for approval or exemption, as required, to implement the procedure.

Surfaces .... Check

Visually inspect the lower and upper wing surfaces.

If there is frost or ice on the lower surface outboard of measuring stick 4, there may also be frost or ice on the upper surface. The distance that the frost extends outboard of measuring stick 4 can be used as an indication of the extent of the frost on the upper surface.

Takeoff with CSFF on lower wing surfaces is allowable provided all of the following conditions are met:

- Ambient air temperature is at or above +4°C, +39°F
- There is no precipitation or visible moisture (rain, snow, drizzle, or fog with less than 1 mile visibility)
- Tank fuel temperature is at or above -16°C, +3°F
- All leading edge devices, all control surfaces, tab surfaces, winglet surfaces, and control surface balance panel cavities must be free of snow, ice and frost.
- All leading edge devices, all control surfaces, tab surfaces, and control surface balance panel cavities must be free of snow, ice and frost.

If all of the above conditions are not met, takeoff with light coatings of frost, up to 1/8 inch (3 mm) in thickness, on lower wing surfaces due to cold fuel is allowable; however, all leading edge devices, all control surfaces, tab surfaces, winglet surfaces and control surface balance panel cavities must be free of snow, ice and frost. If the frost on the lower surface is greater than 1/8 inch (3 mm) in thickness, all snow, ice and frost on the wings must be removed using appropriate deicing/anti-icing procedures.

If all of the above conditions are not met, takeoff with light coatings of frost, up to 1/8 inch (3 mm) in thickness, on lower wing surfaces due to cold fuel is allowable; however, all leading edge devices, all control surfaces, tab surfaces and control surface balance panel cavities must be free of snow, ice and frost. If the frost on the lower surface is greater than 1/8 inch (3 mm) in thickness, all snow, ice and frost on the wings must be removed using appropriate deicing/anti-icing procedures.

Takeoff with CSFF on upper wing surfaces is allowed provided all of the following conditions are met:

- The CSFF on the wing tank upper surfaces is only within the lines defining the permissible CSFF area with no snow, ice or frost on the leading edges or control surfaces
- Ambient air temperature is at or above +4°C, +39°F
- There is no precipitation or visible moisture (rain, snow, drizzle, or fog with less than 1 mile visibility)
- Tank fuel temperature is at or above -16°C, +3°F.

If all of the above conditions are not met, all snow, ice and frost on the upper wing surfaces must be removed using appropriate deicing/anti-icing procedures.

Exterior Safety Inspection - Airplanes without Defined Cold-Soaked Fuel Frost Area

Surfaces .... Check

Visually inspect the lower and upper wing surfaces.

If there is frost or ice on the lower surface outboard of measuring stick 4, there may also be frost or ice on the upper surface. The distance that the frost extends outboard of measuring stick 4 can be used as an indication of the extent of the frost on the upper surface.

Takeoff with CSFF on lower wing surfaces is allowable provided all the following condition are met:

- Ambient air temperature is at or above +4°C, +39°F
- There is no precipitation or visible moisture (rain, snow, drizzle, or fog with less than 1 mile visibility)
- Tank fuel temperature is at or above -16°C, or +3°F
- All leading edge devices, all control surfaces, tab surfaces, winglet surfaces, and control surface balance panel cavities must be free of snow, ice and frost.
- All leading edge devices, all control surfaces, tab surfaces, and control surface balance panel cavities must be free of snow, ice and frost.

If all of the above conditions are not met, takeoff with light coatings of frost, up to 1/8 inch (3 mm) in thickness, on lower wing surfaces due to cold fuel is allowable; however, all leading edge devices, all control surfaces, tab surfaces, winglet surfaces and control surface balance panel cavities must be free of snow, ice and frost. If the frost on the lower surface is greater than 1/8 inch (3 mm) in thickness, all snow, ice and frost on the wings must be removed using appropriate deicing/anti-icing procedures.

If all of the above conditions are not met, takeoff with light coatings of frost, up to 1/8 inch (3 mm) in thickness, on lower wing surfaces due to cold fuel is allowable; however, all leading edge devices, all control surfaces, tab surfaces and control surface balance panel cavities must be free of snow, ice and frost. If the frost on the lower surface is greater than 1/8 inch (3 mm) in thickness, all snow, ice and frost on the wings must be removed using appropriate deicing/anti-icing procedures.

Takeoff with frost on upper wing surfaces due to cold fuel (CSFF) is not allowable. If any frost is present on the upper wing surface, all snow, ice and frost on the wings must be removed using appropriate deicing/anti-icing procedures.

Window Heat System Tests

Overheat Test

The overheat test simulates an overheat condition to check the overheat warning function of the window heat system.

WINDOW HEAT switches .... ON

WINDOW HEAT TEST switch ....OVHT

OVERHEAT lights – On

ON lights – Extinguish

Lights extinguish after approximately 1 minute.

OFF lights – Illuminated

Lights illuminate after approximately 1 minute.

MASTER CAUTION – On

ANTI–ICE system annunciator – On

WINDOW HEAT switches ....Reset

Position the WINDOW HEAT switches OFF, then ON.

Power Test

The power test verifies operation of the window heat system. The test may be accomplished when any of the window heat ON lights are extinguished and the associated WINDOW HEAT switch is ON.

WINDOW HEAT switches .... ON

Note: Do not perform the power test when all ON lights are illuminated

WINDOW HEAT TEST switch .... PWR

The controller is forced to full power, bypassing normal temperature control. Overheat protection is still available.

WINDOW HEAT ON lights .... Illuminated

If any ON light remains extinguished, the window heat system is inoperative. Observe the maximum airspeed limit of 250 kts below 10,000 feet.

Power Test

The power test verifies operation of the window heat system. The test may be accomplished when any of the window heat OFF lights are illuminated and the associated WINDOW HEAT switch is ON.

WINDOW HEAT switches .... ON

Note: Do not perform the power test when all OFF lights are extinguished

WINDOW HEAT TEST switch .... PWR

The controller is forced to full power, bypassing normal temperature control. Overheat protection is still available.

WINDOW HEAT OFF lights .... Extinguished

If any OFF light remains illuminated, the window heat system is inoperative. Observe the maximum airspeed limit of 250 kts below 10,000 feet.

Level Change Climb/Descent

ALTITUDE selector .... Set desired altitude

Note: If a new MCP altitude is selected while in ALT ACQ, the AFDS engages in V/S and the existing vertical speed is maintained.

LVL CHG switch .... Push

Verify FMA display:

Thrust mode (climb) – N1

Thrust mode (descent) – RETARD then ARM

Pitch mode – MCP SPD

IAS/MACH Selector .... Set desired speed

Vertical Speed (V/S) Climb/Descent

ALTITUDE selector .... Set desired altitude

Note: If a new MCP altitude is selected while in ALT ACQ, the AFDS engages in V/S and the existing vertical speed is maintained.

V/S thumbwheel .... Set desired vertical speed

Verify FMA display:

Thrust mode (climb or descent) – MCP SPD

Pitch mode – V/S

IAS/MACH Selector .... Set desired speed

To transition to the vertical speed mode from another engaged climb or descent mode:

V/S mode switch .... Push

V/S climb mode engages at existing V/S.

V/S thumbwheel .... Set desired vertical speed

Verify FMA display:

Thrust mode (climb or descent) – MCP SPD

Pitch mode – V/S

IAS/MACH Selector .... Set desired speed

Intervention of FMC Altitude Constraints during VNAV Climb

[Option - Speed and altitude intervention]

MCP altitude selector .... Set new altitude

New altitude must be higher than the FMC altitude constraint(s) to be deleted.

ALT INTV switch .... Push

Each push of the ALT INTV switch will delete an FMC altitude constraint.

Intervention of FMC Cruise Altitude during VNAV Cruise

[Option - Speed and altitude intervention with FMC U10.8A and earlier]

MCP altitude selector .... Set

ALT INTV switch .... Push

If a higher altitude is selected, a CRZ climb will be started.

If a lower altitude is selected, an early descent will be started.

Intervention of FMC Cruise Altitude during VNAV Cruise

[Option - Speed and altitude intervention with FMC U11.0 and later]

MCP altitude selector .... Set

ALT INTV switch .... Push

If a higher altitude is selected, a CRZ climb will be started.

If the airplane is more than 50 nm from T/D, if a lower altitude is selected, a CRZ descent will be started if the selected altitude is at or above any FMC altitude constraint.

If the airplane is more than 50 nm from T/D, if a lower altitude is selected, an early descent will be started if the selected altitude is below any FMC altitude constraint.

If the airplane is 50 nm or less from T/D, if a lower altitude is selected, an early descent will be started.

Intervention of FMC Altitude Constraints during VNAV Descent

[Option - Speed and altitude intervention]

MCP altitude selector .... Set new altitude

New altitude must be lower than the FMC altitude constraint(s) to be deleted.

ALT INTV switch .... Push

Each push of the ALT INTV switch will delete an FMC altitude constraint.

If all FMC altitude constraints are deleted, the descent mode will revert to a VNAV speed descent.

Intervention of FMC Airspeed Constraints during VNAV

[Option - Speed and altitude intervention]

SPD INTV switch .... Push

MCP IAS/MACH display shows current FMC target speed.

IAS/MACH Selector .... Set desired speed

VNAV remains engaged.

To resume former FMC speed:

SPD INTV switch .... Push

MCP IAS/MACH display blanks and FMC commanded VNAV speed is active.

Altitude Hold

Altitude HOLD switch .... Push

Verify FMA display:

Pitch mode – ALT HOLD

Heading Select

Heading selector .... Set desired heading

Heading select switch .... Push

Verify FMA display:

Roll mode – HDG SEL

VOR Navigation

VHF NAV radio(s) .... Tune and Identify

COURSE selector .... Set desired course

When on an intercept heading to the VOR course:

VOR LOC mode switch .... Push

Verify VOR LOC armed mode annunciates.

A/P automatically captures the VOR course.

Verify VOR LOC engaged mode annunciates upon course capture.

Note: If change to a localizer frequency is desired when captured in the VOR mode, disengage VOR LOC mode prior to selection of the localizer. VOR LOC mode can then be reengaged.

Instrument Approach using Vertical Speed (V/S)

Pilot Flying	Pilot Monitoring

Initially
• If on radar vectors
  • HDG SEL
  • Pitch mode (as needed)
• If enroute to a fix
  • LNAV or other roll mode
  • VNAV or other pitch mode	

Call “FLAPS ___” according to the flap extension schedule.	Set the flap lever as directed. Monitor flaps and slats extension.

Note: If required to remain at or above MDA(H) during the missed approach, the missed approach must be initiated at least 50 feet above MDA(H).

Recommended roll modes:

- RNAV, GPS, TACAN, LOC-BC, VOR or NDB approach: LNAV or HDG SEL.
- LOC, SDF or LDA approach: VOR/LOC or LNAV.

Note: When using LNAV to intercept a localizer, LNAV might parallel the localizer without capturing it. Use HDG SEL to intercept the final approach course, if needed.

Ensure appropriate navaids (VOR, LOC or NDB) are tuned and identified before commencing the approach.

Pilot Flying	Pilot Monitoring
Use LNAV or other roll mode to intercept the final approach course as needed.	
Approximately 2 NM before the final approach fix, set the first intermediate altitude constraint or MDA(H). Set the MCP altitude to the nearest 100 foot increment at or above each intermediate altitude constraint or MDA(H). When the current constraint is assured, set the next constraint before ALT HOLD is engaged to achieve a continuous descent path.	Approximately 2 NM before the final approach fix, call “APPROACHING GLIDE PATH.”
Call: • “GEAR DOWN” • “FLAPS 15.”	Set the landing gear lever to DN. Verify that the green landing gear indicator lights are illuminated. Set the flap lever to 15. [Without automatic ignition] Set the engine start switches to CONT.
Set the speed brake lever to ARM. Verify that the SPEED BRAKE ARMED light is illuminated.	

Before descent to MDA(H):

Pilot Flying	Pilot Monitoring
Call "FLAPS ___" as needed for landing.	Set the flap lever as directed.

At descent point:

Desired V/S ....Set

Set desired V/S to descend to MDA(H). Use a V/S that results in no level flight segment at MDA(H).

Verify V/S mode annunciates.

Pilot Flying	Pilot Monitoring
Call "LANDING CHECKLIST."	Do the LANDING checklist.
At the final approach fix, crosscheck the altimeters. Verify they agree within 100 feet.	

Approximately 300 feet above MDA(H):

MCP altitude .... Set missed approach altitude

At MDA(H)/missed approach point:

If suitable visual reference is not established, execute missed approach.

After suitable visual reference is established:

A/P disengage switch ....Push

Disengage the autopilot in accordance with regulatory requirements.

A/T disengage switch ....Push

Disengage the autothrottle when disengaging the autopilot.

Circling Approach

If a missed approach is needed at any time while circling, make an initial climbing turn toward the landing runway and intercept the missed approach course.

Configuration at MDA(H):

- Gear down
- Flaps 15
- Speedbrake armed

MCP altitude selector ....Set

Set the MCP altitude to the nearest 100 foot increment at or above the MDA(H).

Accomplish an instrument approach, establish suitable visual reference and level off at MCP altitude.

[Option - VNAV ALT not enabled]
Verify ALT HLD mode annunciates.

[Option - VNAV ALT enabled]
Verify ALT HLD or VNAV ALT mode annunciates.

[Option - VNAV ALT enabled]
ALT HLD mode .... Verify/select

Verify ALT HLD mode annunciates.

MCP altitude selector .... Set missed approach altitude

HDG SEL switch .... Push

Verify HDG SEL mode annunciates.

Before starting the turn to base:
- Landing flaps (if not previously selected)
- Do the LANDING checklist.

Intercepting the landing profile:

Autopilot disengage switch .... Push

Autothrottle disengage switch .... Push

Instrument Approach - RNAV (RNP) AR

Note: Operators need approval to conduct RNAV (RNP) AR Instrument Approaches.

[Option - Airplanes without IAN]
Note: For RNAV (GPS) and RNAV (GNSS) procedures use the Landing Procedure - Instrument Approach using VNAV in Normal Procedures.

[Option - Airplanes with IAN]
Note: For RNAV (GPS) and RNAV (GNSS) procedures use the Landing Procedure - Instrument Approach using VNAV or Landing Procedure - Instrument Approach using IAN in Normal Procedures.

Note: This procedure is not authorized using QFE.

[Option - Airplanes with IAN]
Note: This procedure is not authorized using IAN.

The procedure below supplements Normal Preflight, Cruise, Descent and Approach Procedures and replaces the Landing Procedure.

[Without TO/GA to LNAV option]
Additional information is given in case of a go-around.

Preflight Procedure

Review RNP availability predictions.

Pre-approach Requirements

Airplane equipment required to begin the approach:

- EGPWS
- 2 FMCs
- 2 CDUs
- 2 GPS Receivers
- 2 Radio Altimeters
- 2 ADIRUs, IRSs in NAV mode
- 2 EFIS/MAP or PFD/ND displays (as installed)
- 1 A/P and 2 F/Ds capable of LNAV and VNAV(for RNP 0.15 or greater)
- 2 A/P and 2 F/Ds capable of LNAV and VNAV(for RNP less than 0.15)

[Option - Airplanes with FMC U10.7 and newer]
Note: Do the Go-Around and Missed Approach Procedure if the UNABLE REQD NAV PERF-RNP, FMC DISAGREE, or any VERIFY POS alerting message is shown unless suitable visual reference is established and maintained.

[Option - FMC U14.0 and newer]

WARNING: If an UNABLE REQD NAV PERF-RNP is shown during the approach, whether the lateral or vertical RNP are exceeded or not, do the Go-Around and Missed Approach Procedure unless suitable visual reference is established and maintained.

Do the following before starting the approach

- verify that the UNABLE REQD NAV PERF-RNP alert is not displayed
- verify that the approach RNP is equal to or greater than:

  [With NPS]
  - 0.10 (A/P or F/D)

[Without NPS]
  - 0.11 (A/P)

[Without NPS]
  - 0.15 (F/D)
- set current local altimeter (remote altimeter settings not allowed)
- verify that the wind is within limits published for the approach (if applicable)

[Option - Without FMC Temperature Compensation]
- verify that the reported airport temperature is within published limits for the approach

[Option - FMC Temperature Compensation]
- verify that the reported airport temperature is within published limits for the approach unless the Automatic Temperature Compensationfor Approach Altitudes Supplementary Procedure is done.
- review the maximum IAS for each segment of the approach as determined by aircraft category and applicable regulatory airspeed requirements.

Cruise Procedure

Pilot Flying	Pilot Monitoring
	When selecting the approach from the navigation database verify ACT RTE X LEGS page matches the charted approach. If there is an “at or above” altitude restriction before the FAF, it may be changed to an “at” altitude restriction using the same altitude. Speed modifications are allowed as long as the maximum published speed is not exceeded.

Descent Procedure

Pilot Flying	Pilot Monitoring
In the approach briefing include speed and altitude restrictions, missed approach, engine failure, and unable RNP procedures.	Select VOR UPDATE - OFF on the NAV OPTIONS page. Inhibit other navaids as needed per NOTAM.

Approach Procedure

Complete the Approach Procedure before the initial approach fix, or the start of radar vectors to the final approach course.

Note: When receiving radar vectors from ATC, intercept course modifications may be used to join the LNAV path at any point on the initial, intermediate or missed approach segments.

Note: Direct To modifications are not permitted when:

- The fix is the beginning of an RF leg
- The fix is the Final Approach Fix (FAF) for the procedure.

Pilot Flying	Pilot Monitoring
	On the RNP PROGRESS page verify RNP for the approach.

[With NPS]

Note: For airplanes with NPS, verify that the vertical RNP is 125 feet. While there are no vertical RNP values published on the approach chart, the use of 125 feet will cause the NPS amber deviation exceedance alert to occur at 75 feet or slightly less deviation, since vertical ANP will be at least 50 feet at all times.

Landing Procedure

[With NPS]

Pilot Flying	Pilot Monitoring

Initially
• If on radar vectors
  • HDG SEL
  • Pitch mode (as needed)
• If enroute to a fix
  • LNAV or other roll mode
  • VNAV or other pitch mode	

	Notify the cabin crew to prepare for landing. Verify that the cabin is secure.
Select TERR on map. Select CDU: ACT RTE X LEGS page.	Select TERR or WX radar on map.
Use LNAV and VNAV or other pitch mode for initial descent. VNAV is required from the FAF inbound. Some approach procedures can require use of VNAV from the IAF inbound. On intercept heading, select or verify LNAV.	

Pilot Flying	Pilot Monitoring
Call "FLAPS ___" according to the flap extension schedule or approach speed constraint.	Set the flap lever as directed. Monitor flaps and slats extension.
Approximately 2 NM before the final approach fix and after ALT HOLD or VNAV PTH or VNAV ALT (as installed) is annunciated: • set DA(H) on the MCP • select or verify VNAV [Option- Speed and altitude intervention] • select or verify speed intervention (as needed)	
Maximum Lateral Deviation (XTK ERROR): NPS amber indication or 1 x RNP Maximum Vertical Deviation - FAF to DA: 75 feet Monitor NPS	
Approaching glide path, call: • "GEAR DOWN" • "FLAPS 15"	Set the landing gear lever to DN. Verify that the green landing gear indicator lights are illuminated. Set the flap lever to 15.
Set the speed brake lever to ARM. Verify that the SPEED BRAKE ARMED light is illuminated.	
Beginning the final approach descent, call "FLAPS ___" as needed for landing.	Set the flap lever as directed.
Call "LANDING CHECKLIST."	Do the LANDING checklist.
At the final approach fix, verify the crossing altitude and crosscheck altimeters within 100 feet between primary altimeters.	
Monitor the approach.	

Pilot Flying	Pilot Monitoring
When at least 300 feet below the missed approach altitude, set the missed approach altitude on the MCP	
If suitable visual reference is established at DA(H), disengage the autopilot in accordance with regulatory requirements, and disengage the autothrottle at the same time. Maintain the glide path to landing.	

[Without TO/GA to LNAV option]

Note: If a go-around/missed approach is needed, track the required course manually using the trend vector and map until LNAV is selected.

Landing Procedure

[Without NPS]

Pilot Flying	Pilot Monitoring

Initially
• If on radar vectors
  • HDG SEL
  • Pitch mode (as needed)
• If enroute to a fix
  • LNAV or other roll mode
  • VNAV or other pitch mode	

	Notify the cabin crew to prepare for landing. Verify that the cabin is secure.
Select TERR on map. Select CDU: ACT RTE X LEGS page.	Select TERR or WX radar on map. Select CDU: RNP PROGRESS page.
One pilot must have the map display in 10 NM range or less to monitor path tracking during the final approach segment.	
Use LNAV and VNAV or other pitch mode for initial descent. VNAV is required from the FAF inbound. Some approach procedures can require use of VNAV from the IAF inbound. On intercept heading, select or verify LNAV.	
Call “FLAPS ___” according to the flap extension schedule or approach speed constraint.	Set the flap lever as directed. Monitor flaps and slats extension.

Pilot Flying	Pilot Monitoring
Approximately 2 NM before the final approach fix and after ALT HOLD or VNAV PTH or VNAV ALT (as installed) is annunciated: • set DA(H) on the MCP • select or verify VNAV [Option- Speed and altitude intervention] • select or verify speed intervention (as needed)	
	Maximum Lateral Deviation (XTK ERROR): 1 x RNP Maximum Vertical Deviation - FAF to DA: 75 feet Monitor RNP PROGRESS page
Approaching glide path, call: • “GEAR DOWN” • “FLAPS 15”	Set the landing gear lever to DN. Verify that the green landing gear indicator lights are illuminated. Set the flap lever to 15. [Without automatic ignition] Set the engine start switches to CONT.
Set the speed brake lever to ARM. Verify that the SPEED BRAKE ARMED light is illuminated.	
Beginning the final approach descent, call “FLAPS ___” as needed for landing.	Set the flap lever as directed.
Call “LANDING CHECKLIST.”	Do the LANDING checklist.
When at least 300 feet below the missed approach altitude, set the missed approach altitude on the MCP.	
At the final approach fix, verify the crossing altitude and crosscheck altimeters within 100 feet between primary altimeters.	

<table>
<tr><th>Pilot Flying</th><th>Pilot Monitoring</th></tr>
<tr><td colspan="2">Monitor the approach.

[The requirement for map display at 10NM is only for aircraft without NPS]
(At least one pilot must have map display set to 10NM range)</td></tr>
<tr><td>If suitable visual reference is established at DA(H), disengage the autopilot in accordance with regulatory requirements, and disengage the autothrottle at the same time.

Maintain the glide path to landing.</td><td></td></tr>
</table>

[Without TO/GA to LNAV option]

Note: If a go-around/missed approach is needed, track the required course manually using the trend vector and map until LNAV is selected.

Aircraft Communication Addressing and Reporting System (ACARS)

The following procedures are applicable to the noted ACARS functions from the company pages.

Pre-Departure Clearance

The flight crew shall manually verify (compare) the filed flight plan versus the digital pre-departure clearance and shall initiate voice contact with Air Traffic Control if any question/confusion exists between the filed flight plan and the digital pre-departure clearance.

Digital-Automatic Information Service

The flight crew shall verify that the D-ATIS altimeter setting numeric value and alpha value are identical. If the D-ATIS altimeter setting numeric value and alpha values are different, the flight crew must not accept the D-ATIS altimeter setting.

Oceanic Clearances

The flight crew shall manually verify (compare) the filed flight plan versus the digital oceanic clearance and initiate voice contact with Air Traffic Control if any questions/confusion exists between the filed flight plan and the digital oceanic clearance.

Weight and Balance

The flight crew shall verify the Weight and Balance numeric and alphabetical values are identical. If the Weight and Balance numeric and alphabetical values are different, the flight crew must not accept the Weight and Balance data.

Takeoff Data

The flight crew shall verify the Takeoff Data numeric and alphabetic values are identical. If the Takeoff Data numeric and alphabetic values are different, the flight crew must not accept the Takeoff Data message.

Cockpit Voice Recorder Test

[Option]

[Option - Voice Recorder switch]

Note: The Cockpit VOICE RECORDER switch must be in the ON position or at least one engine must be operating to perform this test.

Test switch .... Push

After a slight delay, observe that the monitor indicator rises into the green band. A tone may be heard through a headset plugged into the headset jack.

The indicator remains in the green band and the tone continues until the switch is released.

Cockpit Voice Recorder Test

[Option]

[Option - Voice Recorder switch]

Note: The Cockpit VOICE RECORDER switch must be in the ON position or at least one engine must be operating to perform this test.

Test switch .... Push

Hold switch for 5 seconds. Observe that the STATUS light flashes once. A tone may be heard through a headset plugged into the headset jack.

Electrical Power Up

The following procedure is accomplished to permit safe application of electrical power.

BATTERY switch .... Guard closed

[Option]

Note: Do not move the airplane until Integrated Standby Flight Display (ISFD) alignment is complete.

[Option - Airplanes with Flight Deck Auxiliary Power Outlets]

Note: Devices plugged into the flight deck auxiliary power outlets during Electrical Power Up will not be powered until the plugs are removed and reinserted.

STANDBY POWER switch .... Guard closed

ALTERNATE FLAPS master switch .... Guard closed

Windshield WIPER selectors .... PARK

ELECTRIC HYDRAULIC PUMPS switches .... OFF

LANDING GEAR lever .... DN

Verify that the green landing gear indicator lights are illuminated.

Verify that the red landing gear indicator lights are extinguished.

If external power is needed:

Verify that the GRD POWER AVAILABLE light is illuminated.

GRD POWER switch – ON

Verify that the SOURCE OFF lights are extinguished.

Verify that the TRANSFER BUS OFF lights are extinguished.

Verify that the STANDBY PWR OFF light is extinguished.

If APU power is needed:

Verify that the engine No. 1, APU and the engine No. 2 fire switches are in.

Alert ground personnel before the following test is accomplished.

OVERHEAT DETECTOR switches – NORMAL

TEST switch – Hold to FAULT/INOP

Verify that the MASTER CAUTION lights are illuminated.

Verify that the OVHT/DET annunciator is illuminated.

Verify that the FAULT light is illuminated.

If the FAULT light fails to illuminate, the fault monitoring system is inoperative.

Verify that the APU DET INOP light is illuminated.

Do not operate the APU if the APU DET INOP light fails to illuminate.

TEST switch – Hold to OVHT/FIRE

Verify that the fire warning bell sounds.

Verify that the master FIRE WARN lights are illuminated.

Verify that the MASTER CAUTION lights are illuminated.

Verify that the OVHT/DET annunciator is illuminated.

Master FIRE WARN light – Push

Verify that the master FIRE WARN lights are extinguished.

Verify that the fire warning bell cancels.

Verify that the engine No. 1, APU and the engine No. 2 fire switches stay illuminated.

[Airplanes with the NEW Engine Start Levers]
Verify that the engine No. 1 and engine No. 2 start lever lights stay illuminated.

Verify that the ENG 1 OVERHEAT and ENG 2 OVERHEAT lights stay illuminated.

Note: The WHEEL WELL fire warning light on the overheat and fire protection panel may or may not illuminate when testing on DC electrical power only. For accurate testing, do the wheel well fire detection system test after AC electrical power is established.

EXTINGUISHER TEST switch – Check

TEST Switch - Position to 1 and hold

Verify that the three green extinguisher test lights are illuminated.

TEST Switch - Release

Verify that the three green extinguisher test lights are extinguished.

Repeat for test position 2.

APU - Start

Note: If extended APU operation is needed on the ground and the airplane busses are powered by AC electrical power, position an AC powered fuel pump ON. This will extend the service life of the APU fuel control unit.

Note: If fuel is loaded in the center tank, position the left center tank fuel pump switch ON to prevent a fuel imbalance before takeoff.

CAUTION: Center tank fuel pump switches should be positioned ON only if the fuel quantity in the center tank exceeds 1000 lbs/453 kgs.

CAUTION: Do not operate the center tank fuel pumps with the flight deck unattended.

When the APU GEN OFF BUS light is illuminated:

APU GENERATOR bus switches - ON

Verify that the SOURCE OFF lights are extinguished.

Verify that the TRANSFER BUS OFF lights are extinguished.

Verify that the STANDBY PWR OFF light is extinguished.

Verify that the APU MAINT light is extinguished.

Verify that the APU LOW OIL PRESSURE light is extinguished.

Verify that the APU FAULT light is extinguished.

Verify that the APU OVERSPEED light is extinguished.

Wheel well fire detection system ....Test

Test switch – Hold to OVHT/FIRE

Verify fire warning bell sounds, master FIRE WARN lights, MASTER CAUTION lights and OVHT/DET annunciator illuminate.

Fire warning BELL CUTOUT switch – Push

Verify that the master FIRE WARN lights extinguish.

Verify that the fire warning bell cancels.

Verify that the WHEEL WELL fire warning light is illuminated.

Electrical Power Down

This procedure assumes the Secure procedure is complete.

APU switch and/or GRD POWER switch ....OFF

If APU was operating:

Delay approximately 2 minutes after the APU GEN OFF BUS light extinguishes before placing the BATTERY switch OFF.

BATTERY switch ....OFF

Standby Power Test

[Option - Single battery]

Battery switch ....ON

AC and DC meter selectors ....STBY PWR

If APU generator is on–line:

BUS TRANSFER switch ....OFF

APU GEN No. 2 switch or GRD PWR switch ....OFF

Turn OFF appropriate switch depending on power source in use. Removes power from TR 3.

STANDBY POWER switch ....OFF

Check STANDBY PWR OFF light illuminated.

AC–DC voltmeters ....Zero

STANDBY POWER switch ....BAT

Check STANDBY PWR OFF Light extinguished

AC–DC voltmeters ....Check

AC voltmeter 115 +/-5 volts

DC voltmeter 24 +/-4 volts

Frequency meter ....Check

Check frequency meter for normal indication: 400 +/- 5 CPS.

STANDBY POWER switch ....AUTO

BUS TRANS switch ....AUTO

APU GEN No. 2 switch or GRD PWR switch ....ON

Note: It can take up to 3 minutes for CDS displays to recover when power is interrupted for more than 2 seconds on the ground.

Standby Power Test

[Option – Dual battery]

Battery switch ....ON

AC and DC meter selectors ....STBY PWR

If APU generator is on–line:

APU GEN No. 1 switch ....OFF

APU GEN No. 2 switch ....OFF

If ground power is on–line:

GRD PWR switch ....OFF

STANDBY POWER switch ....OFF

Check STANDBY PWR OFF light illuminated.

AC–DC voltmeters ....Zero

STANDBY POWER switch ....BAT

Check STANDBY PWR OFF Light extinguished.

AC–DC voltmeters ....Check

AC voltmeter 115 +/-5 volts

DC voltmeter 24 +/-4 volts

Frequency meter ....Check

Check frequency meter for normal indication: 400 +/- 5 CPS.

DC meter selector ....BAT

Check DC voltmeter for normal indication: 24 +/- 2 volts.

Check DC ammeter for discharge indication: a negative value.

DC meter selector .... AUX BAT

Check DC voltmeter for normal indication: 24 +/- 2 volts.

Check DC ammeter for discharge indication: a negative value.

STANDBY POWER switch .... AUTO

GRD PWR switch or APU GEN No. 1 and No. 2 switches .... ON

Note: It can take up to 3 minutes for CDS displays to recover when power is interrupted for more than 2 seconds on the ground.

Battery Start

(With APU bleed or ground air available)

Maintenance documents .... Check

[Option]
FLIGHT DECK ACCESS SYSTEM
switch .... Guard closed

BATTERY switch .... Guard closed

[Option]

Note: Do not move the airplane until Integrated Standby Flight Display (ISFD) alignment is complete.

ELECTRIC HYDRAULIC PUMPS
switches.. OFF

LANDING GEAR lever ....DN

Verify that the green landing gear indicator lights are illuminated.

Verify that the red landing gear indicator lights are extinguished.

Emergency equipment .... Check

Fire extinguisher - Checked and stowed

Crash axe - Stowed

Escape ropes - Stowed

Other needed equipment - Checked and stowed.

Flight recorder switch .... Guard closed

Circuit breakers (P6 panel) .... Check

Circuit breakers (control stand, P18 panel) .... Check

Accomplish the Interior and Exterior Inspection if required, except for items requiring electrical or hydraulic power.

Verify that the oxygen pressure is sufficient for flight.

Accomplish the following Preflight Procedure - First Officer items:

Overheat and fire protection panel ....Check

OVERHEAT DETECTOR switches - NORMAL

TEST switch - Hold to FAULT/INOP

TEST switch - Hold to OVHT/FIRE

EXTINGUISHER TEST switch - Check

APU switch
(bleed air source, if available) ....START

On the captain's command, the first officer reads and the captain does the following items:

Oxygen .... Test and set

CAB/UTIL power switch .... ON

IFE/PASS seat power switch .... ON

EMERGENCY EXIT LIGHTS switch ....Guard closed

Passenger signs ....Set

HYDRAULIC PUMP switches .... ON

Air conditioning panel ....Set

PACK switches - AUTO or HIGH

Engine BLEED air switches - ON

APU BLEED air switch - ON

SPEED BRAKE lever ....DOWN detent

Reverse thrust levers .... Down

Forward thrust levers ....Closed

Parking brake ....Set

Note: The wheels should be chocked in case the brake pressure has bled down.

Engine start levers ....CUTOFF

Papers ....Aboard

When cleared for Engine Start, do the following:

Air conditioning PACK switches .... OFF

ANTICOLLISION light switch ....ON

Ignition select switch .... IGN-R

Engine Start

Engine No. 1 start .... Accomplish

Only N1, N2, and oil quantity are displayed until the EECs are powered.

Generator 1 switch ....ON

IRS mode selectors .... OFF, then NAV

Verify that the ON DC lights illuminate, then extinguish

Verify that the ALIGN lights are illuminated.

FMC/CDU .... Set IRS position

Verify that the following are sufficient for flight:

- hydraulic quantity
- engine oil quantity

WARNING: If engine No. 1 was started using a ground air source, to minimize the hazard to ground personnel, the external air should be disconnected and engine No. 2 started using the Engine Crossbleed Start procedure.

Engine No. 2 start .... Accomplish

Generator 2 switch ....ON

Cabin pressurization panel .... Set

FLIGHT ALTITUDE indicator - Cruise altitude

LANDING ALTITUDE indicator - Destination field elevation

Pressurization mode selector - AUTO

Verify that the ALTN light is extinguished.

Verify that the MANUAL light is extinguished.

Complete the Preliminary Preflight Procedure - Captain or First Officer by doing the following items:

PSEU light .... Verify extinguished

GPS light .... Verify extinguished

[Option - GLS]
ILS light .... Verify extinguished

[Option - GLS]
GLS light .... Verify extinguished

SERVICE INTERPHONE switch ....OFF

ENGINE panel ....Set

Verify that the REVERSER lights are extinguished

Verify that the ENGINE CONTROL lights are extinguished

EEC switches - ALTN then ON

Oxygen panel ....Set

CREW OXYGEN pressure indicator - Check

Verify that the pressure meets dispatch requirements.

Note: PASSENGER OXYGEN switch activation causes deployment of the passenger oxygen masks.

PASSENGER OXYGEN switch - Guard closed

Verify that the PASS OXY ON light is extinguished.

Landing gear indicator lights ....Verify illuminated

[Option]
Emergency EVACUATION activation switch ....Guard closed

Verify that the EVAC light is extinguished

Manual gear extension access door ....Closed

Accomplish the normal CDU Preflight Procedure - Captain and First Officer, Preflight Procedure - First Officer, Preflight Procedure - Captain, Before Start Procedure and Before Taxi Procedure to ensure that the flight deck preparation is complete.

BEFORE TAXI checklist ....Accomplish

IRS alignment .... Complete

The airplane is ready for taxi. Refer to the normal checklists for subsequent checks.

Starting with Ground Air Source (AC electrical power available)

Engine No. 1 must be started first.

When cleared to start:

APU BLEED air switch .... OFF

Engine No. 1 start .... Accomplish

Use normal start procedures.

WARNING: To minimize the hazard to ground personnel, the external air should be disconnected, and engine No. 2 started using the Engine Crossbleed Start procedure.

Engine Crossbleed Start

Do not accomplish a crossbleed start during pushback.

Before using this procedure, ensure that the area to the rear is clear.

Engine BLEED air switches ....ON

APU BLEED air switch .... OFF

PACK switches .... OFF

ISOLATION VALVE switch ....AUTO

Ensures bleed air supply for engine start.

Engine thrust lever
(operating engine) .... Advance thrust lever

Advance thrust lever until bleed duct pressure indicates 30 PSI.

Non–operating engine .... Start

Use normal start procedures with crossbleed air.

After starter cutout, adjust thrust on both engines, as required.

Setting N1 Bugs with No Operative FMC (Manual N1 Bug Setting)

Reference the Performance – Inflight section to determine N1 setting for desired phase of flight.

N1 SET outer knob .... BOTH

The last FMC computed value is displayed by reference N1 bugs and readouts. If the FMC has not calculated an input since power up, a default value of 104% is displayed.

N1 SET inner knob .... Set N1

Note: If the N1 SET outer knob is returned to the AUTO position, the bugs and readouts will revert to the last FMC computed value or 104% if the FMC has not calculated an input since power up.

High Altitude Airport Engine Start (Above 8400 Feet)

[Option - High Altitude Landing option with or without High Altitude Landing switch]

Engine start .... Accomplish

An indication of N1 rotation plus maximum motoring and a minimum of 20% N2 are required prior to introducing fuel to the engine.

Note: Maximum motoring occurs when N2 acceleration is less than 1% in approximately 5 seconds.

Fire and Overheat System Test with an Inoperative Loop

[Airplanes with the OLD Engine Start Levers]

To determine the specific inoperative loop:

OVHT DET switches .... A

Test switch .... OVHT/FIRE

If the FAULT light stays extinguished and both ENG OVERHEAT lights and engine fire switches illuminate, loop A is good.

If the FAULT light illuminates and the ENG OVERHEAT light and engine fire switch for an engine stay extinguished, there is a fault in loop A of the detection system for that engine.

OVHT DET switches ....B

Test switch .... OVHT/FIRE

If the FAULT light stays extinguished and both ENG OVERHEAT lights and engine fire switches illuminate, loop B is good.

If the FAULT light illuminates and the ENG OVERHEAT light and engine fire switch for an engine extinguished, there is a fault in loop B of the detection system for that engine.

OVHT DET switches ....As required

Select the good loop for each engine (NORMAL if both loops tested good).

Test switch .... OVHT/FIRE

If the test is successful leave the fire panel in this configuration for flight.

Fire and Overheat System Test with an Inoperative Loop

[Airplanes with the NEW Engine Start Levers]

To determine the specific inoperative loop:

OVHT DET switches .... A

Test switch .... OVHT/FIRE

If the FAULT light stays extinguished and both ENG OVERHEAT lights, engine start lever lights, and engine fire switches illuminate, loop A is good.

If the FAULT light illuminates and the ENG OVERHEAT light, engine start lever light, and engine fire switch for an engine stay extinguished, there is a fault in loop A of the detection system for that engine.

OVHT DET switches .... B

Test switch .... OVHT/FIRE

If the FAULT light stays extinguished and both ENG OVERHEAT lights, engine start lever lights, and engine fire switches illuminate, loop B is good.

If the FAULT light illuminates and the ENG OVERHEAT light, engine start lever light, and engine fire switch for an engine stay extinguished, there is a fault in loop B of the detection system for that engine.

OVHT DET switches .... As required

Select the good loop for each engine (NORMAL if both loops tested good).

Test switch .... OVHT/FIRE

If the test is successful leave the fire panel in this configuration for flight.

Altimeter Difference

Note: If flight in RVSM airspace is planned use the RVSM table in the limitations section.

This procedure is accomplished when there is a noticeable difference between the altimeters. Accomplish this procedure in stabilized level flight or on the ground.

Altimeter barometric settings .... Check

Check all altimeters set to proper barometric setting for phase of flight.

Standby altimeter baro set control ....Rotate and reset

Rotate to a different setting, then reset proper barometric setting.

Altimeters .... Crosscheck

Maximum differences between the altimeter readings:

Altitude	CDS/CDS	CDS/Standby
Sea Level	50 feet	60 feet
5,000 feet	50 feet	80 feet
10,000 feet	60 feet	120 feet
15,000 feet	70 feet	(see note)
20,000 feet	80 feet	(see note)
25,000 feet	100 feet	(see note)
30,000 feet	120 feet	(see note)
35,000 feet	140 feet	(see note)
40,000 feet	160 feet	(see note)
41,000 feet	170 feet	(see note)

Note: Above 10,000 feet and 0.4 Mach, position error causes the tolerance to diverge rapidly and direct crosscheck becomes inconclusive. Between 10,000 feet and 29,000 feet, differences greater than 400 feet should be suspect and verified by ground maintenance checks. Between 29,000 feet and the maximum operating altitude, differences greater than 500 feet should be suspect and verified by ground maintenance checks.

If it is not possible to identify which altimeter is indicating the correct altitude:

ATC .... Notify

QFE Operation

[Option - PFD/ND and Altimeter with QFE]

Use this procedure when ATC altitude assignments are referenced to QFE altimeter settings.

Note: Do not use LNAV or VNAV.

[Option - VSD]
Note: Do not use the vertical situation display.

[Option - IAN]
Note: Instrument approaches using IAN are not authorized.

FMC/CDU APPROACH REFERENCE page
or TAKEOFF REFERENCE page 2/2 .... Select

LANDING REF line select key .... Push

Verify QFE selected.

[This sets the landing altitude to zero.]

Altimeters .... Set

Set altimeters to QFE when below transition altitude/level.

Note: If the QFE altimeter setting is beyond the range of the altimeters, QNH procedures must be used with QNH set in the altimeters.

LAND ALT indicator .... Set at zero

QFE Operation

[Option - EFIS MAP]

Use this procedure when ATC altitude assignments are referenced to QFE altimeter settings.

Note: Do not use LNAV or VNAV.

[Option - VSD]
Note: Do not use the vertical situation display.

Altimeters ....Set

Set altimeters to QFE when below transition altitude/level.

Note: If the QFE altimeter setting is beyond the range of the altimeters, QNH procedures must be used with QNH set in the altimeters.

LAND ALT indicator ....Set at zero

Setting Airspeed Bugs with No Operative FMC (Manual Airspeed Bug Setting)

To set reference airspeed bugs for takeoff:

Speed reference selector (outer) V1

Default speed of 80 knots is displayed.

Speed reference selector (inner) ....Set V1 speed

V1 bug is displayed when a speed greater than 80 knots is set. The NO VSPD flag is displayed until both V1 and VR are set.

Speed reference selector (outer) .... VR

Default speed of 80 knots is displayed.

Speed reference selector (inner) .... Set VR speed

VR bug is displayed when a speed greater than 80 knots is set. The NO VSPD flag is removed after both V1 and VR are set.

MCP speed selector ....Set V2

Airspeed cursor and V2+15 bug move to the correct speeds.

Speed reference selector (outer) ....WT

Default weight of 32,000 kgs / 70,000 lbs is displayed.

Speed reference selector (inner) .... Set takeoff gross weight

Flaps up maneuver speed bug is displayed.

Note: If VREF is selected on the ground, INVALID ENTRY is displayed.

To set the spare bug, if desired:

Speed Reference selector (outer) .... Spare bug

Default speed of 60 knots is displayed.

Speed reference selector (inner) .... Set

Set speed as desired.

Speed reference selector (outer) ....SET

Digital readout is removed.

Note: When the flap lever is set to any takeoff flap setting above flaps 1, a bug comes into view for the next smaller flap maneuvering speed, between takeoff flaps and flaps up. For example, if the flap lever is set to 15 for takeoff, a bug for flaps 5 maneuvering speed will appear. For a flaps 1 takeoff, the flaps 1 maneuvering speed will be displayed.

To set reference airspeed bugs for approach:

Speed reference selector (outer) .... WT

Default weight of 32,000 kgs / 70,000 lbs is displayed.

Speed reference selector (inner) ....Set current gross weight

Flaps up maneuver speed bug is displayed.

Speed reference selector (outer) .... VREF

Default speed of 80 knots is displayed.

Speed reference selector (inner) .... Set VREF speed

The green VREF bug and white VREF +15 bug are shown when a speed greater than 80 knots is set.

The green VREF bug and white VREF +20 bug are shown when a speed greater than 80 knots is set.

Note: If V1 or VR is selected in flight, INVALID ENTRY is displayed.

To set the spare bug, if desired:

Speed reference selector (outer) ....Spare bug

Default speed of 60 knots is displayed.

Speed reference selector (inner) ....Set

Set speed as desired.

Speed reference selector (outer) .... SET

Digital readout is removed.

HUD System Procedures

[Option - Rockwell Collins HUD]

HUD system procedures supplement normal procedures and should be accomplished when applicable.

Preflight Procedure

If the HUD will be used for takeoff, or configured for a possible return for landing, accomplish the following during the Preflight Procedure:

HUD System .... Set

Combiner – Lowered, cover removed

Runway Data – Set in control panel

Enter runway length

The runway length entered must be between 7,500 and 13,500 feet (2,287 and 4,114 meters).

Enter TDZE (if available) or field elevation

Enter glideslope angle for possible return for landing.

The glideslope angle must be set between -2.50° and -3.00° for an AIII approach.

Mode – Set

Select IMC or VMC to verify proper alignment

ALIGN HUD light – Extinguished

After checking alignment, select PRI mode

Note: CLR may be selected to blank display during taxi. Push CLR again to restore display. If the HUD will not be used for takeoff, the combiner should be stowed.

For a low visibility takeoff, enter the ILS frequency and set the course to takeoff runway magnetic heading.

Descent

If HUD will be used for approach and landing, accomplish the following steps:

Prior to completing the DESCENT checklist:

HUD System .... Set

Combiner – Lowered, cover removed

Runway Data – Set in control panel

Enter runway length.

The runway length entered must be between 7,500 and 13,500 feet (2,287 and 4,114 meters) for an AIII guided landing rollout.

Enter runway TDZE (if available) or field elevation

Enter glideslope angle

The glideslope angle must be set between -2.50° and -3.00° for an AIII approach.

Mode – Set

Select IMC or VMC to verify proper alignment

ALIGN HUD light – Extinguished

After checking alignment, select PRI mode

Prior to intercepting final on a visual approach:

Select VMC mode

After intercepting final on an instrument approach:

Select IMC mode, if needed

IMC mode is an alternate approach mode primarily intended for AFDS approaches.

Note: During approach, the PM will monitor the HUD ANNUNCIATOR panel.

Landing

If HUD will be used for a CAT II or CAT IIIa approach:

At glideslope capture:

Select/verify AIII mode active

Shutdown

Accomplish the following step during the Shutdown Procedure:

HUD Combiner ....Stowed

If the airplane will be secured, install cover before stowing.

Intentionally
Blank

Tests

Transponder Test

This procedure requires the IRSs to be aligned and in NAV mode.

Transponder .... TEST

Check FAIL light illuminates.

Check all code segments illuminate. Verify no error codes exist.

Verify aural indicates TCAS system test passed.

Note: TCAS TEST is displayed on the navigation display during the test followed by TCAS TEST PASSED or TCAS TEST FAILED. This test remains in view for 8 seconds then blanks. An aural annunciation sounds at the completion of the test.

[Option - Honeywell and L3 TCAS computers]

AURAL ALERTS	DEFINITION
“TCAS TEST” “TCAS TEST FAIL”	Test failed. Maintenance required.
“TCAS TEST” “TCAS TEST OK”	Test complete. System operable.

[Option - Allied Signal TCAS computer]

AURAL ALERTS	DEFINITION
“TCAS SYSTEM TEST FAIL”	Test failed. Maintenance required.
“TCAS SYSTEM TEST OK”	Test complete. System operable.

Weather Radar Test

EFIS mode selector .... MAP, MAP CTR, VOR, or APP

Weather Radar Mode .... TEST

STAB .... ON

WXR (EFIS control panel) .... ON

Verify test pattern consisting of the following colors appears:
- Green
- Amber
- Red
- Magenta.

[Option - With predictive wind shear]
If testing of the PWS system is desired:

Weather Radar Mode ....Deselect TEST

WXR (EFIS control panel) .... ON

Weather Radar Mode .... TEST

Verify the amber WINDSHEAR caution, red WINDSHEAR warning and PWS FAIL annunciations display momentarily and then extinguish.

Note: In the short time the weather radar is on and not in the TEST position, it will radiate.

IRS

Align Light(s) Flashing

Do not move IRS Mode selector to OFF except where called for in procedure.

POS INIT page .... Select

Set IRS position ....Enter present position

Enter present position using the most accurate latitude and longitude available. If the present position is being entered via the CDU and a position is already displayed on the SET IRS POS line, enter new position over displayed position.

If ALIGN light continues to flash:

Set IRS position ....Enter present position

Re-enter same present position.

If ALIGN light continues to flash after re-entry:

IRS .... OFF

Rotate IRS Mode Selector to OFF and verify ALIGN light extinguished.

Note: Light must be extinguished before continuing with procedure (approximately 30 seconds.)

IRS .... NAV

Rotate IRS Mode Selector to NAV and verify ALIGN light illuminated.

Set IRS position .... Enter present position

Enter present position. If ALIGN light flashes, re-enter same present position over displayed position.

Note: Approximately five to seventeen minutes are required for alignment.

If ALIGN light continues to flash, maintenance action is required.

Fast Realignment

Prior to commencing procedure the airplane must be parked and not moved until procedure is complete and ALIGN lights extinguish.

IRS mode selectors .... ALIGN

Observe ALIGN lights illuminate steadily.

CDU ....Set

Enter present position on SET IRS POS line of the POS INIT page.

IRS mode selector..NAV

Observe ALIGN light extinguished within 30 seconds.

Note: If time permits it is preferable to perform a full alignment of the IRS. A more precise alignment will result.

Note: If the mode selector is accidentally switched to OFF or ATT, position mode selector to OFF, wait for ALIGN light(s) to extinguish, then perform full alignment procedure.

Inadvertent Selection of Attitude Mode (while on the ground)

Inadvertent selection of the attitude mode may be due to physically overpowering the switch during turn–on or may be the result of a faulty switch which prevents the flight crew from accurately determining which mode is selected.

If ATT position is selected inadvertently when switching to NAV

IRS mode selectors ....OFF

Observe ALIGN lights extinguish.

After ALIGN lights extinguish, initiate a full alignment.

IRS Entries

Present Position Entry

IRS mode selector ....NAV

ALIGN lights must be illuminated (steady or flashing).

IRS display selector ....PPOS

Latitude ....Enter

Key–in latitude in the data display, beginning with N or S, then press the ENT Key (the Cue Lights extinguish).

Longitude ....Enter

Key–in longitude in the data display, beginning with E or W, then press the ENT key (the cue lights extinguish). Observe that proper latitude and longitude are displayed and that the ALIGN light is not flashing.

Heading – Enter through CDU

FMC/CDU POS INIT page .... Select

Enter the correct heading into the CDU scratch pad then press line select key 5R. Verify entered heading appears on line 5R. Select HDG on the IRS display selector and verify that the entered heading is displayed on the navigation displays.

Heading – Enter through ISDU

IRS display selector .... HDG

Press the H key to initiate a heading entry.

Key–in present magnetic heading. Press the ENT key (the cue lights extinguish). Observe proper heading displayed on the navigation displays.

Lateral Navigation (LNAV)

Proceeding Direct to a Waypoint (overwrite)

RTE LEGS page .... Select

On page 1/XX, line 1L, enter desired waypoint over the presently active waypoint.

Correct any ROUTE DISCONTINUITY if entered waypoint was not in original flight plan.

[Option - With abeam points]
If abeam waypoints are desired:

ABEAM PTS key .... Push

EXEC key .... Push

Observe the MOD RTE LEGS page changes to ACT.

Proceeding Direct to a Waypoint (DIR/INTC)

[Option - CDU]

DIR INTC key .... Push

Observe DIRECT TO box prompts displayed in line 6L.

Enter desired waypoint on the DIRECT TO line. Observe the waypoint automatically transfers to line 1L.

Correct any ROUTE DISCONTINUITY if entered waypoint was not in the original flight plan.

EXEC key .... Push

Observe MOD RTE LEGS page changes to ACT.

Intercepting a Leg (Course) to a Waypoint

RTE LEGS page .... Select

On page 1/XX, line 1L, enter desired waypoint over presently active waypoint.

Observe INTC CRS prompt displayed in line 6R.

Enter the desired intercept course in the INTC CRS line. Observe the desired course is displayed on line 6R. The displayed course on line 1L may vary by several degrees due to magnetic variation.

Correct any ROUTE DISCONTINUITY if the entered waypoint was not in original flight plan.

EXEC key .... Push

Observe MOD RTE LEGS page changes to ACT.

LNAV may disengage after execution of an intercept leg to a waypoint. If LNAV disengages, turn to a heading to satisfy LNAV capture criteria, as described in Chapter 11, and then engage LNAV.

Intercepting a Leg (Course) to a Waypoint (DIR/INTC)

[Option - CDU]

DIR INTC key .... Push

Observe INTC LEG TO box prompts displayed in line 6R.

Enter the desired waypoint on the INTC LEG TO line. Observe the waypoint automatically transfers to line 1L.

Enter the desired intercept course in the INTC CRS line. Observe the desired course is displayed on line 6R. The displayed course on line 1L may vary by several degrees due to magnetic variation.

Correct any ROUTE DISCONTINUITY if the entered waypoint was not in original flight plan.

EXEC key .... Push

Observe MOD RTE LEGS page changes to ACT.

LNAV may disengage after execution of an intercept leg to a waypoint. If LNAV disengages, turn to a heading to satisfy LNAV capture criteria, as described in Chapter 11, and then engage LNAV.

Route Modification

[Option - FMC U10.8A or earlier]

RTE LEGS or RTE page .... Select

Line select existing waypoints in the desired sequence.

Key–in any new waypoints in the scratch pad and line select into the flight plan. Correct any ROUTE DISCONTINUITY.

EXEC key .... Push

Observe MOD RTE or MOD RTE LEGS page changes to ACT.

Active Route Modification

[Option - FMC U11 and later]

ACT RTE x LEGS or ACT RTE x page .... Select

Line select existing waypoints in the desired sequence.

Key–in any new waypoints in the scratch pad and line select into the flight plan. Correct any ROUTE DISCONTINUITY.

EXEC key .... Push

Observe MOD RTE x LEGS or MOD RTE x page changes to ACT.

Inactive Route Modification

[Option - FMC U11 and later]

RTE x LEGS or RTE x page .... Select

Line select existing waypoints in the desired sequence.

Key–in any new waypoints in the scratch pad and line select into the flight plan. Correct any ROUTE DISCONTINUITY.

Note: The flight number should not be changed in the inactive route as it will change the flight number in the active route.

Route Copy

[Option - FMC U11 and later]

ACT RTE x LEGS or ACT RTE x page .... Select

RTE COPY line select key .... Push

Inactive Route Activation

[Option - FMC U11 and later]

RTE x LEGS or RTE x page .... Select

ACTIVATE line select key .... Push

Correct any ROUTE DISCONTINUITY.

EXEC key .... Push

Route Removal

RTE page .... Select

ORIGIN .... Enter

If EXEC key illuminates

EXEC key .... Push

Linking a Route Discontinuity

Correct the ROUTE DISCONTINUITY by entering or deleting waypoints in a sequence that provides a continuous flight–plan path.

EXEC key .... Push

Observe MOD RTE or MOD RTE LEGS page changes to ACT.

Determining ETA and Distance to Cross Radial (Bearing) or Distance from a Fix

FIX INFO page .... Select

Enter the identifier of the reference waypoint (normally an off–route waypoint) onto the FIX line. Enter the desired radial or distance from the FIX on a RAD/DIS line, or line select the ABM prompt if the desired radial from the FIX is perpendicular to the present route/course.

Time and distance to go .... Check

Check ETA and DTG, as desired.

Note: If ETA and DTG are not displayed, the fix radial and/or distance do not intersect the route.

Changing Destination

RTE page .... Select

Enter the new destination over the original DEST. Enter desired routing to the new destination using the RTE, RTE LEGS, and ARRIVALS pages, as appropriate. Correct any ROUTE DISCONTINUITY.

EXEC key .... Push

Observe the MOD RTE or MOD RTE LEGS page changes to ACT.

Note: If destination is changed during climb, performance predictions may be blanked if the new flight plan is incompatible with the entered cruise altitude. Correct by entering a lower CRZ ALT on the CLB page.

Entering Holding Fix Into Route

HOLD key .... Push

(If RTE HOLD page is displayed, observe NEXT HOLD prompt. Line select 6L until (RTE LEGS) HOLD AT page is displayed.)

Observe HOLD AT box prompts and PPOS prompt (if in flight) are displayed. Enter the holding fix in line 6L, or line select PPOS.

If the holding fix is a waypoint in the active route, or PPOS was selected, observe MOD RTE HOLD page displayed. If the holding fix is a waypoint not in the active route, observe message HOLD AT XXXXX displayed in the scratch pad. Enter the holding fix into the route by line selecting in the desired waypoint sequence. Observe the MOD RTE HOLD page displayed. If displayed holding details are incorrect or inadequate, enter correct information on appropriate line(s).

EXEC key .... Push

Observe MOD RTE HOLD page changes to RTE HOLD (ACT RTE HOLD if holding at PPOS).

Exiting Holding Pattern

HOLD key .... Push

Observe EXIT HOLD prompt displayed.

EXIT HOLD line select key .... Push

Observe EXIT HOLD prompt changes to EXIT ARMED.

EXEC key .... Push

Observe EXIT ARMED is highlighted in reverse video and LNAV flight returns to the holding fix and resumes the active route.

Note: The holding pattern may be exited by performing a DIRECT TO modification if desired. In this case, the flight path may not return to the holding fix before proceeding to the selected waypoint.

[Option - FMC update U10.2 and later]

Note: A late sequencing of the hold exit waypoint may occur if multiple route modifications are performed just prior to exiting the hold. LNAV guidance may be temporarily interrupted while sequencing the hold exit waypoint.

Along Track Displacement

RTE LEGS page .... Select

Line select the reference waypoint to the scratch pad. Add a "/" and the + or – distance desired. (EX: SEA/15 for a point 15 miles downtrack from SEA)

Line select the reference waypoint. (The FMC will automatically position the created waypoint to appropriate position.)

EXEC key .... Push

Observe the MOD RTE LEGS page change to ACT.

Entering Created Waypoints on the Route or Route Legs Pages

Note: Created waypoints are stored in the temporary navigation data base for one flight only.

RTE or RTE LEGS page .... Select

Using any of the following methods, key into the scratch pad the parameters which define the new created waypoint (place identifiers must already be stored in one of the FMC data bases):

- Place bearing/distance (for example, SEA250/40);
- Place bearing/place bearing (for example, SEA180/ELN270);
- Along–track displacement (for example, SEA/-10);
- Latitude and longitude (for example, N4731.8W12218.3).

Enter into the route by line selecting to the appropriate waypoint sequence.

Repeat the above steps to define additional created waypoints as desired. Correct any ROUTE DISCONTINUITY.

EXEC key .... Push

Observe the MOD RTE or MOD RTE LEGS page changes to ACT (for an inactive route, activate and execute on the RTE or RTE LEGS page).

Entering Created Waypoints on the Nav Data Pages

Note: Created waypoints entered on the SUPP NAV DATA pages (permitted on the ground only) are stored in the supplemental navigation data base for an indefinite time period; those entered on REF NAV DATA pages are stored in the temporary navigation data base for one flight only.

INIT/REF key .... Push

Observe INDEX prompt displayed.

INIT/REF INDEX page .... Select

Observe the NAV DATA prompt displayed. To access the SUPP NAV DATA page, enter SUPP into the scratch pad.

NAV DATA page .... Select

(If the SUPP NAV DATA page is selected, observe the EFF FRM date line displayed. If an effective date had not been previously entered, box prompts are displayed. The effective date must be entered before proceeding. If required, enter the current or appropriate date on EFF FRM line and execute.)

Data .... Enter

Enter a crew-assigned identifier on either the WPT IDENT, NAVAID IDENT, or AIRPORT IDENT line, as appropriate. Use the navaid category only for stations with DME.

For a WPT IDENT entry, define the waypoint with entries for either latitude and longitude, or with entries for REF IDENT and RADIAL/DIST (REF IDENT identifier must already be stored in one of the FMC data bases).

For a NAVAID IDENT or AIRPORT IDENT entry, enter appropriate data.

EXEC key illuminates when data has been entered into all box prompts.

EXEC key .... Push

Repeat above steps to define additional created waypoints as desired. To enter a new identifier in the same category, simply overwrite the previous identifier.

Note: To enter a created waypoint into the flight plan, key the identifier into the scratch pad and follow the route modification procedure.

Deleting Created Waypoints on the Nav Data Pages

INIT/REF key .... Push

Observe the INDEX prompt displayed.

INIT/REF INDEX page .... Select

Observe the NAV DATA prompt displayed. To access the SUPP NAV DATA page, key SUPP into the scratch pad.

NAV DATA page .... Select

Enter the identifier on either the WPT IDENT, NAVAID IDENT, or AIRPORT IDENT line, as appropriate.

Data ....Delete

Push the DEL key and then line select the identifier. Observe the EXEC key illuminates.

EXEC key .... Push

Data previously entered is deleted. Observe NAV DATA page displayed with prompts.

Entering a Crossing Radial (Bearing) or Distance from a Fix as a Route Waypoint

FIX INFO page .... Select

Enter identifier of the reference waypoint (normally an off–route waypoint) onto the FIX line. Enter the desired radial or distance from the FIX on a RAD/DIS line, or line select the ABM prompt if the desired radial or distance from the FIX is perpendicular to the present route/course.

Line select the desired intersection (lines 2L–5L) into the scratch pad and observe the new created waypoint displayed as FIX/Radial/Distance.

RTE LEGS page .... Select

Line select the new created waypoint, displayed in the scratch pad, to the desired waypoint sequence.

Repeat the above steps to define additional created waypoints as desired. Correct any ROUTE DISCONTINUITY.

EXEC key .... Push

Observe the MOD RTE LEGS page changes to ACT.

Note: These created waypoints are stored in the temporary navigation data base for one flight only.

Entering a Lateral Offset

RTE page .... Select

Observe the OFFSET prompt displayed.

LATERAL OFFSET page .... Select

Observe dash prompts for OFFSET DIST.

OFFSET DIST .... Enter

Enter desired offset distance using format Lxx or Rxx for left or right offset up to 99 nm. Observe dash prompts for START WAYPOINT and END WAYPOINT.

START/END WAYPOINT .... Enter

If no start/end waypoint is entered, offset will begin/end at first/last valid offset leg.

Change SID or Runway

This entire procedure must be accomplished when a SID is used and the runway or SID is changed. This will prevent the possibility of incorrect routing or inadequate obstacle clearance.

DEPARTURES page .... Select

RUNWAY .... Reselect

SID .... Reselect

TRANSITION (if required) .... Reselect

RTE LEGS page .... Select

WAYPOINT SEQUENCE and ALTITUDES ....Check

Modify as necessary to agree with clearance.

EXEC key ....Push

Change STAR, PROF DES, or APP

The associated airport must be entered as route origin or destination.

ARRIVAL page ....Select

STAR or PROFILE DESCENT (if required) ....Select

TRANSITION (if required) ....Select

APPROACH ....Select

APPROACH TRANSITION (if required) ....Select

RTE LEGS page ....Select

WAYPOINT SEQUENCE ....CHECK

Modify as necessary to agree with clearance.

EXEC key ....Push

Delete Procedure Turn

DEP/ARR page ....Select

Approach ....Select

Reselecting same approach or selecting a new approach will remove procedure turn and select a straight in approach on the LEGS page.

EXEC key ....Push

or

RTE LEGS page ....Select

Select last waypoint of procedure turn to scratchpad and overwrite PROC TURN line. Check waypoint sequencing to comply with clearance.

EXEC key ....Push

Other Operations

FMC Navigation Check

[Option - FMC update U11.0 or later]

Do the following as needed to ensure navigation accuracy if any alerting message listed below is shown in the scratch pad or course deviation is suspected:

- GPS-L INVALID and GPS-R INVALID (both)
- IRS-L DRIFT
- IRS-R DRIFT
- UNABLE REQD NAV PERF - RNP
- VERIFY POS: FMC-FMC
- VERIFY POS: FMC-GPS
- VERIFY POS: FMC-RADIO
- VERIFY POS: IRS-FMC
- VERIFY POS: IRS-IRS
- VERIFY POS: IRS-RADIO

[Option - FMC update U10.7 to U10.8A]

Do the following as needed to ensure navigation accuracy if any alerting message listed below is shown in the scratch pad or course deviation is suspected:

- GPS-L INVALID and GPS-R INVALID (both)
- UNABLE REQD NAV PERF - RNP
- VERIFY POS: FMC-FMC
- VERIFY POS: FMC-GPS
- VERIFY POS: FMC-RADIO
- VERIFY POS: IRS-FMC
- VERIFY POS: IRS-IRS
- VERIFY POS: IRS-RADIO

Actual position....................Determine and compare with FMC position

Determine actual airplane position using raw data from VHF navigation or ADF radios.

If radio navaids are unavailable:

FMC position .... Compare with the IRS position

Use the POS SHIFT page of the FMC CDU. If the two IRS positions are in agreement and the FMC position is significantly different, the FMC position is probably unreliable. The POS SHIFT page may be used to shift FMC position to one of the IRS positions. This is accomplished by line selecting the IRS or radio position and then pressing the EXEC Key.

Actual position .... Confirm with ATC radar or visual reference points.

Navigate using most accurate information available (continue to monitor FMC position using VOR/ADF raw data displays on non–flying pilot's navigation display).

CAUTION: Navigating in LNAV mode with an unreliable FMC position may result in significant navigation errors.

Navigate by conventional VOR/ADF procedures, radar vectors from ATC, dead reckoning from last known position, and/or use of visual references.

Inhibiting VOR/DME Use for Position Updating

Note: This procedure inhibits the use of VOR/DME information for FMC position updating. Use DEL key to remove a VOR/DME from inhibit status.

PROG page .... Select

Observe NAV STATUS prompt displayed.

NAV STATUS page .... Select

NAV OPTIONS page .... Select (NEXT/PREV page)

Observe dash prompts for VOR/DME INHIBIT. Enter desired VOR/DME identifier (a previous entry may be overwritten but will no longer be inhibited).

Inhibiting GPS Updating

[Option - With GPS]

Note: Inhibit GPS updates for approach operations that are not based on WGS-84, unless other appropriate procedures are used.

PROG page .... Select

Observe NAV STATUS prompt displayed.

NAV STATUS page .... Select

NAV OPTIONS page .... Select (NEXT/PREV page)

GPS UPDATE .... OFF

Automatic Temperature Compensation for Approach Altitudes

[Option - FMC U14 and newer with Temp Comp]

Note: This procedure is not authorized using QFE.

Note: When using temperature compensation, advise ATC of the corrections. Failure to do so may lead to loss of vertical separation between airplanes.

Note: FMC temperature compensation applies corrections to all FMC waypoint altitudes from the START WAYPOINT including the missed approach waypoints.

Note: Verify all FMC temperature compensated waypoint altitudes comply with ATC clearance.

Note: For hot temperature altitude corrections:

- In the event of a go-around or missed approach, observe charted altitude restrictions. After flaps are set to the planned flap setting and at or above the flap maneuvering speed, select LVL CHG. Do not use VNAV.

A temperature altitude correction is not needed for the following conditions:

- while under ATC radar vectors
- when maintaining an ATC assigned flight level (FL)

Note: Regulatory authorities may have other requirements for temperature altitude corrections.

Select and execute instrument approach to be flown in the DEP/ARR INDEX page.

APPROACH REF page .... Select

Use the INIT REF key to display the APPROACH REF page.

NEXT PAGE key .... Push

Use the NEXT PAGE key to display the TEMP COMP REF page.

Destination airport .... Verify

Destination airport temperature .... Enter and execute

A destination airport temperature can only be entered after an instrument approach has been selected.

START WAYPOINT .... Set or verify

START WAYPOINT defaults to the IAF for the selected approach.

The START WAYPOINT can be manually changed to any other waypoint before the IAF is sequenced.

Note: For hot temperature, apply corrections to the final approach segment by changing the START WAYPOINT to the FAF. Hot temperature compensation can be applied to other segments of the approach with ATC approval.

Note: Once the START WAYPOINT is sequenced, the START WAYPOINT blanks and cannot be reselected until the destination airport temperature is deleted and re-selected.

Temperature Compensated Altitudes .... Verify

On the ACT RTE X LEGS page the START WAYPOINT and all subsequent waypoints are identified as temperature compensated by an asterisk (*) to the right of the altitude.

For cold temperature correction, verify that the temperature compensation altitudes are higher than the published altitudes.

For hot temperature correction, verify that the temperature compensation altitudes are lower than the published altitudes.

To calculate the temperature compensated altitude that is not in the active flight plan, if needed:

ALT .... Enter

Enter a barometric altitude at LSK 4L to determine the temperature compensated altitude. The temperature compensated barometric altitude is shown under TEMP COMP ALT at LSK 4R.

Note: Enter all the digits for the MSL altitude, for example, enter "500" for 500 feet or "5000" for 5000 feet MSL.

Note: Altitude entries are for information only and does not affect the altitudes on the ACT RTE X LEGS page.

For cold temperature correction, set the MDA/DA at the corrected minimum altitudes for the approach. FMC temperature compensation applies corrections to all the missed approach waypoints.

If the corrected indicated altitude to be flown is between 100 foot increments, set the MCP altitude to the closest 100 foot increment above the corrected indicated altitude to be flown.

For additional information on temperature corrections to departure, enroute and approach altitudes, refer to the Cold Temperature Altitude Corrections Supplementary Procedure (SP 16).

Vertical Navigation (VNAV)

Temporary Level Off during Climb or Descent (Not at FMC Cruise Altitude)

MCP altitude selector .... Set desired altitude

[Option - With VNAV ALT]
Verify VNAV ALT is annunciated on the flight mode annunciator when leveling at the selected MCP altitude.

[Option - Without VNAV ALT]
Verify ALT HOLD is annunciated on the flight mode annunciator when leveling at the selected MCP altitude.

MCP N1 light extinguishes if leveling from a climb.

N1 limit changes to CRZ if leveling from a climb.

To continue climb or descent:

MCP altitude selector ....Set desired altitude

[Option - With VNAV ALT]
ALT INTV switch..Push

Climb or descent is initiated. Mode annunciations appear as initial climb or descent.

[Option - Without VNAV ALT]
VNAV switch..Push

Climb or descent is initiated. Mode annunciations appear as initial climb or descent.

Intervention of FMC Altitude Constraints during VNAV Climb

[Option - With speed and altitude intervention]

MCP altitude selector .... Set new altitude

New altitude must be higher than the FMC altitude constraint(s) to be deleted.

ALT INTV switch .... Push

Each push of the ALT INTV switch will delete an FMC altitude constraint.

Intervention of FMC Cruise Altitude during VNAV Cruise

[Option - Speed and altitude intervention with FMC U10.8A and earlier]

MCP altitude selector .... Set

ALT INTV switch .... Push

If a higher altitude is selected, a CRZ climb will be started.

If a lower altitude is selected, an early descent will be started.

Intervention of FMC Cruise Altitude during VNAV Cruise

[Option - Speed and altitude intervention with FMC U11.0 and later]

MCP altitude selector .... Set

ALT INTV switch .... Push

If a higher altitude is selected, a CRZ climb will be started.

If the airplane is more than 50 nm from T/D, if a lower altitude is selected, a CRZ descent will be started if the selected altitude is at or above any FMC altitude constraint.

If the airplane is more than 50 nm from T/D, if a lower altitude is selected, an early descent will be started if the selected altitude is below any FMC altitude constraint.

If the airplane is 50 nm or less from T/D, if a lower altitude is selected, an early descent will be started.

Intervention of FMC Altitude Constraints during VNAV Descent

[Option - With speed and altitude intervention]

MCP altitude selector .... Set new altitude

New altitude must be lower than the FMC altitude constant (s) to be deleted.

ALT INTV switch .... Push

Each push of the ALT INTV switch will delete an FMC altitude constraint.

If all FMC altitude constraints are deleted, the descent mode will revert to a VNAV speed descent.

Intervention of FMC Airspeed Constraints during VNAV

[Option - With speed and altitude intervention]

SPD INTV switch .... Push

MCP IAS/MACH display shows current FMC target speed.

MCP speed selector .... Set desired speed

VNAV remains engaged.

To resume former FMC speed:

SPD INTV switch .... Push

MCP IAS/MACH display blanks and FMC commanded VNAV speed is active.

Entering Waypoint Speed and Altitude Restriction (On Climb or Descent Legs Only)

RTE LEGS page .... Select

Key–in desired speed and altitude, or speed only (followed by /), or altitude only, into scratch pad.

An altitude followed by A or B signifies a requirement to be “at or above” or “at or below” that altitude at the waypoint (for example, key–in 220A or 240B).

Line select to desired waypoint line.

EXEC key .... Push

Observe MOD RTE LEGS page changes to ACT.

Note: This changes any prior speed and altitude restriction at this waypoint.

Deleting Waypoint Speed and Altitude Restriction

RTE LEGS page .... Select

Push DEL key to enter DELETE in scratch pad. Line select to appropriate waypoint line.

EXEC key .... Push

Observe MOD RTE LEGS page changes to ACT and restriction is deleted and replaced with an FMC predicted value (small size characters).

Changing Speed and/or Altitude Restriction during Climb or Descent

CLB/DES page .... Select

Push DEL key to enter DELETE in the scratch pad, or key–in the desired speed and altitude in the scratch pad. Line select to the SPD REST line.

EXEC key .... Push

Observe the MOD CLB or the MOD DES page changes to ACT and the restriction is changed or deleted.

Changing Climb/Cruise/Descent Speed Schedule

CLB/CRZ/DES page .... Select

Select the prompt for the desired climb/cruise/descent schedule, or key–in the desired speed in the scratch pad and line select to the TGT SPD line.

EXEC key .... Push

Observe the MOD CLB, MOD CRZ, or MOD DES page changes to ACT and new speed schedule is specified.

Early Descent

MCP altitude selector .... Set

Set next level–off altitude.

DES page .... Select

Line select DES NOW prompt.

EXEC key .... Push

Observe MOD DES page changes to ACT. Observe descent is initiated (if VNAV engaged).

Note: For a PATH DES, this will result in a 1000 FPM rate of descent until the planned path is intercepted. For a SPD DES, this will result in an idle thrust normal rate of descent.

Step Climb or Descent from Cruise

MCP altitude selector .... Set

Set new level–off altitude.

FLT ALT indicator .... Set

Set new level–off altitude.

CRZ page .... Select

Enter new altitude on the CRZ ALT line. The display changes to MOD CRZ CLB or MOD CRZ DES.

If the desired climb/descent speed is different from the displayed cruise speed, manually enter the desired TGT SPD, or use access prompts to select desired CLB/DES page.

EXEC key .... Push

Observe the MOD CRZ CLB/MOD CRZ DES page (or other selected MOD CLB/MOD DES page) changes to ACT. Observe climb/descent is initiated at the TGT SPD (if VNAV engaged).

Performance and Progress Functions

Determining ETA and Fuel Remaining for New Destination

RTE page .... Select

Enter the new destination over the original DEST. Enter correct routing to the new destination using RTE, RTE LEGS, and ARRIVALS pages, as appropriate. Correct any ROUTE DISCONTINUITY.

PROGRESS page .... Select

Observe new destination with a MOD title. Check ETA and FUEL remaining.

RTE page .... Select

EXEC or ERASE the new destination/routing, as desired. Observe MOD RTE page changes to ACT.

Estimated Wind Entries for Cruise Waypoints

RTE LEGS page .... Select

Observe the DATA prompt displayed.

RTE DATA page .... Select

Enter the estimated true wind direction/speed on the appropriate line(s).

Step Climb Evaluation

CRZ page .... Select

Enter the desired step climb altitude on the STEP line. If known, enter the estimated average true wind direction/speed for the desired step climb altitude on the ACTUAL WIND line.

Step climb savings .... Determine

Observe the fuel SAVINGS/PENALTY and FUEL AT ______ (destination) lines to determine if a higher cruise altitude is advantageous.

If step climb fuel savings are significant, use the appropriate climb procedure to initiate climb to the higher altitude when NOW is displayed on STEP POINT line.

Note: Step climb evaluations do not consider buffet margin limits. If the altitude entered for the step climb evaluation is higher than the maximum altitude for flight with an adequate buffet margin, the message “MAX ALT FLXXX” will be displayed in the scratch pad. Ensure the new cruise altitude entered for the climb is at or below the MAX ALT displayed in the message in order to maintain a safe buffet margin.

Entering Descent Forecasts

DES page .... Select

Observe FORECAST prompt displayed.

DES FORECASTS page .... Select

Verify the TRANS LVL and revise if required. Enter average ISA DEV forecast for descent and destination QNH. Enter forecast descent WINDs (for up to three different altitudes).

EXEC key .... Push

Observe MOD DES FORECASTS page changes to ACT.

Engine Out

Engine out climb and cruise pages provide advisory information for engine out operation. Refer to section 11.41 and 11.42 for a complete description of ENG OUT CLB and ENG OUT CRZ pages.

Required Time of Arrival (RTA)

Note: An active FMC flight plan complete with all performance data must exist before the required time of arrival (RTA) mode can be used.

Entering an RTA Waypoint and Time

RTA PROGRESS page .... Select

On PROGRESS page 3, line 1L, enter the flight plan waypoint where required time of arrival is applicable. Observe the MOD RTA PROGRESS page displayed with the computed ETA, for the entered waypoint, displayed in line 1R.

RTA ....Enter

Enter required time of arrival into line 1R. Time should be entered in hours, minutes, and seconds (Examples: 174530, 1745, 1745.5). Observe MOD RTA PROGRESS page displayed with pertinent data for complying with entered RTA. Observe EXEC key illuminated.

EXEC key .... Push

Observe ACT RTA PROGRESS page displayed.

Entering Speed Restrictions for RTA Navigation

PERF LIMITS page .... Select

Enter minimum or maximum speed restriction for RTA navigation in lines 2, 3, or 4 depending on phase of flight. Observe RTA parameters change to reflect new limits (RTA PROGRESS page) and EXEC key illuminated.

EXEC key .... Push

Observe MOD PERF LIMITS page change to ACT PERF LIMITS page.

Note: Entered restrictions on line 2, 3, and 4 also restrict other navigation modes such as ECON.

Entering New Time Error Tolerances for RTA Navigation

PERF LIMITS page .... Select

Enter desired time error tolerance (5 to 30 seconds) for the RTA waypoint on line 1L (Example: 25). Observe MOD PERF LIMITS page displayed and EXEC key illuminated.

EXEC key .... Push

Observe ACT PERF LIMITS page displayed.

Additional CDU Functions

Navigation Display Plan Mode (Center Step Operation)

EFIS Control Panel Mode Selector ....PLAN

RTE LEGS page .... Select

EFIS Control Panel Range Selector .... As required

MAP CTR STEP key .... Push

Each push moves the CTR label to the next geographically fixed waypoint in the route. Selecting PREV PAGE or NEXT PAGE moves the CTR label to the first geographically fixed waypoint on the new page.

EFIS Control Panel Mode Selector .... As required

Enter Position Shift on Runway

TAKEOFF REF page .... Select

[Option - Runway position update with TO/GA activation]
TO SHIFT distance .... Enter

Enter distance desired from runway threshold. When TO/GA is pushed, FMC will update position to runway threshold plus entered distance.

[Option - Runway remaining update with TO/GA activation]
RWY REMAIN distance .... Enter

Enter runway remaining distance. When TO/GA is pushed, FMC will update to the runway remaining distance.

If position shift must be removed

RTE page .... Select

RWY .... Enter

Reenter runway on RTE page. Check and reenter other performance data as required.

Intentionally
Blank

Fuel Balancing

If an engine fuel leak is suspected:

Accomplish the Fuel Leak Engine checklist.

If the fuel IMBAL alert shows:

Accomplish the IMBAL checklist.

Maintain main tank No. 1 and No. 2 fuel balance within limitations.

Note: Fuel pump pressure should be supplied to the engines at all times. At high altitude, without fuel pump pressure, thrust deterioration or engine flameout may occur.

If the center tank contains fuel:

Center tank fuel pump switches .... OFF

[Fuel CONFIG indication may be displayed with fuel in the center tank.]

Crossfeed selector .... Open

Fuel pump switches (low tank) .... OFF

When quantities are balanced:

Fuel pump switches (main tank) .... ON

Center tank fuel pump switches .... ON

Crossfeed selector .... Close

If the center tank contains no fuel:

Crossfeed selector .... Open

Fuel pump switches (low tank) .... OFF

When quantities are balanced:

Fuel pump switches .... ON

Crossfeed selector .... Close

Refueling

Fuel Load Distribution

Main tanks No. 1 and No. 2 should normally be serviced equally until full. Additional fuel is loaded into the center tank until the desired fuel load is reached.

Note: Main tanks No. 1 and No. 2 must be scheduled to be full if the center tank contains more than 453 kgs / 1,000 lbs of fuel. With less than 453 kgs / 1,000 lbs of center tank fuel, partial main tank fuel may be loaded provided the effects of balance have been considered.

Fuel Pressure

Apply from a truck or fuel pit. A nozzle pressure of 50 psi provides approximately 1136 liters / 300 U.S. gallons per minute.

Normal Refueling

[Option - Fuel Quantity selector]
When a full fuel load is required, the fuel shutoff system closes the fueling valves automatically when the tanks are full. When a partial fuel load is required, the fuel shutoff system closes the fueling valves automatically when the quantity preselected on the fuel quantity selector (located on the test gauges and fueling panel) is reached.

[Option - Without Fuel Quantity selector]
When a full fuel load is required, the fuel shutoff system closes the fueling valves automatically when the tanks are full. When a partial fuel load is required, the fuel quantity indicators are monitored and the fueling valves are closed by manually positioning the fueling valve switches to CLOSED when the desired fuel quantity is aboard the airplane.

Refueling with Battery Only

When the APU is inoperative and external power is not available, refueling can be accomplished as follows:

Battery switch .... ON

Note: The refueling system will operate normally. Operation is limited only by battery life.

Refueling with No AC or DC Power Source Available

When it becomes necessary to refuel with the APU inoperative, the aircraft battery depleted, and no external power source available, refueling can still be accomplished:

Fueling hose nozzle .... Attached to the refueling receptacle

Fueling valves ....Open for the tanks to be refueled

Note: Main tanks No. 1 and No. 2, and the center tank refueling valves each have a red override button that must be pressed and held while fuel is being pumped into the tank. Releasing the override button allows the spring in the valve to close the valve.

Caution must be observed not to overfill a tank, since there is no automatic fuel shutoff during manual operation. When the desired amount of fuel has been pumped into the tanks, the refueling valves for the respective tanks can be released.

Ground Transfer of Fuel

[Pure Fleet Auto Shutoff]

Fuel can be transferred from one tank to another tank using the fuel pumps, fueling valve, defueling valve, and crossfeed valve. AC power must be available.

Note: Before transferring fuel, ensure that the associated FUEL PUMP LOW PRESSURE lights are operating.

[Passenger Airplanes]

CAUTION: Transferring fuel with passengers onboard is prohibited, unless the fuel quantity in the tank from which fuel is being taken is maintained at or above 2000 pounds/900 kilograms.

[Freighter Airplanes]

CAUTION: Transferring fuel with supernumeraries onboard is prohibited, unless the fuel quantity in the tank from which fuel is being taken is maintained at or above 2000 pounds/900 kilograms.

To transfer fuel from the main tanks to the center tank:

Main tank fuel pump switches ....ON

Crossfeed selector .... Open

Manual defueling valve .... Open

Center tank fueling valve switch .... OPEN

Fuel transfer ....Monitor

The center tank fuel quantity indicator shows an increase in fuel. The main tank indicators show a decrease in fuel.

When a FUEL PUMP LOW PRESSURE light illuminates, turn OFF the associated fuel pump.

When the required amount of fuel has been transferred:

Center tank fueling valve switch .... CLOSED

Manual defueling valve .... Close

Crossfeed selector .... Close

Main tank fuel pump switches ....OFF

Main Tanks .... Refill

Refueling panel and defuel panel access doors .... Close

Ground Transfer of Fuel

[Mixed Fleet Auto Shutoff]

Fuel can be transferred from one tank to another tank using the fuel pumps, fueling valve, defueling valve, and crossfeed valve. AC power must be available.

Note: Before transferring fuel, ensure that the associated FUEL PUMP LOW PRESSURE lights are operating.

[AD 2002-19-52 and AD 2002-24-51]

[Passenger Airplanes]

CAUTION: Transferring fuel with passengers onboard is prohibited.

[Alternate Method of Compliance (AMOC) to AD 2002-24-51]

[Passenger Airplanes]

CAUTION: Transferring fuel with passengers onboard is prohibited, unless the fuel quantity in the tank from which fuel is being taken is maintained at or above 2000 pounds/900 kilograms.

[Alternate Method of Compliance (AMOC) to AD 2001-08-24 and AD 2002-24-51 for Airplanes with Master Caution System Logic Change and Automatic Shutoff]

[Passenger Airplanes]

CAUTION: Transferring fuel with passengers onboard is prohibited, unless the fuel quantity in the tank from which fuel is being taken is maintained at or above 2000 pounds/900 kilograms.

To transfer fuel from the main tanks to the center tank:

Main tank fuel pump switches ....ON

Crossfeed selector ....Open

Manual defueling valve ....Open

Center tank fueling valve switch ....OPEN

Fuel transfer .... Monitor

The center tank fuel quantity indicator shows an increase in fuel. The main tank indicators show a decrease in fuel.

When a FUEL PUMP LOW PRESSURE light illuminates, turn OFF the associated fuel pump.

When the required amount of fuel has been transferred:

Center tank fueling valve switch ....CLOSED

Manual defueling valve ....Close

Crossfeed selector ....Close

Main tank fuel pump switches .... OFF

Main Tanks ....Refill

Refueling panel and defuel panel access doors ....Close

Fuel Crossfeed Valve Check

Crossfeed selector ....Open

Verify crossfeed VALVE OPEN light illuminates bright and then dim.

Crossfeed selector ....Close

Verify crossfeed VALVE OPEN light illuminates bright and then extinguishes.

Ground Proximity Warning System (GPWS) and Runway Awareness and Advisory System (RAAS) Test

[Option - With Runway Awareness and Advisory System]

Verify IRS alignment is complete.

Verify that the guards are closed for all GROUND PROXIMITY INHIBIT switches.

Ground proximity SYS TEST switch .... Push momentarily

Verify the following:

- BELOW G/S and GPWS INOP lights illuminate
- TERR FAIL and TERR TEST annunciations show on navigation displays
- PULL UP and WINDSHEAR alerts illuminate
- “GLIDESLOPE”, “PULL UP” and “WINDSHEAR” aurals sound
- “TERRAIN TERRAIN PULLUP" aural sounds
- terrain display test pattern shows on navigation displays
- TERRAIN caution message shows on navigation displays

[Option - Peaks and Obstacles]
- "OBSTACLE OBSTACLE PULLUP" aural sounds

During the test the RUNWAY INOP light illuminates and one of the following aurals announces the status of the RAAS System:

- "RUNWAY AWARENESS OK - FEET/METERS" (as installed)
- "RUNWAY AWARENESS NOT AVAILABLE"
- "RUNWAY AWARENESS INOP"

[Option - Airspeed Low]
Verify the following:

- "AIRSPEED LOW" aural sounds

Note: If the test switch is held until the aurals begin, additional GPWS aural warnings are tested.

Ground Proximity Warning System (GPWS), Overrun Warning (ORW) System, and Runway Awareness and Advisory System (RAAS) Test

[Option - GPWS, RAAS, and ORW]

Verify IRS alignment is complete.

Verify that the guards are closed for all GROUND PROXIMITY INHIBIT switches.

Ground proximity SYS TEST switch .... Push momentarily

Verify the following:

- BELOW G/S and GPWS INOP lights illuminate
- TERR FAIL and TERR TEST annunciations show on navigation displays
- PULL UP and WINDSHEAR alerts illuminate
- “GLIDESLOPE”, “PULL UP” and “WINDSHEAR” aurals sound
- “TERRAIN TERRAIN PULLUP" aural sounds
- terrain display test pattern shows on navigation displays
- TERRAIN caution message shows on navigation displays

  [Option - Peaks and Obstacles]
- "OBSTACLE OBSTACLE PULLUP" aural sounds

During the test the RUNWAY INOP light illuminates and one of the following aurals announces the status of the ORW and RAAS System:

- "RUNWAY AWARENESS OK - FEET/METERS" (as installed)
- "RUNWAY AWARENESS NOT AVAILABLE"
- "RUNWAY AWARENESS INOP"

[Option - Airspeed Low]
Verify the following:

- "AIRSPEED LOW" aural sounds

Note: If the test switch is held until the aurals begin, additional GPWS aural warnings are tested.

Runway Awareness and Advisory System (RAAS) Inhibit Operation

[Option - With Runway Awareness and Advisory System]

If one or more of the following exist:

- The airport or runway is not in the GPWS database
- A NOTAM applies to the intended runway
- Airline policy prohibits the use of RAAS for an airport or runway.

RUNWAY INHIBIT switch .... INHIBIT

Note: If the RUNWAY INHIBIT switch is in the INHIBIT position and the airspeed is 250 knots or greater for 60 seconds or more, the RUNWAY INOP light illuminates. The RUNWAY INOP light extinguishes when airspeed is below 250 knots.

After takeoff, if RAAS use is allowed at the destination:

RUNWAY INHIBIT switch .... NORM

Overrun Warning (ORW) System, and Runway Awareness and Advisory System (RAAS) Inhibit Operation

[Option - ORW and RAAS]

Before departure if one or more of the following exist:

- The airport or runway is not in the GPWS database
- A NOTAM applies to the intended runway
- Airline policy prohibits the use of RAAS for an airport or runway.

RUNWAY INHIBIT switch .... INHIBIT

Note: If the RUNWAY INHIBIT switch is in the INHIBIT position, and the airspeed is 250 knots or greater for 60 seconds or more, the RUNWAY INOP light illuminates. The RUNWAY INOP light extinguishes when airspeed is below 250 knots.

After takeoff:

RUNWAY INHIBIT switch .... NORM

Before approach if one or more of the following exist or are planned:

- The airport is not in the GPWS database
- A NOTAM applies to the intended runway
- Airline policy prohibits the use of ORW for an airport or runway
- Conducting Land and Hold Short Operations (LAHSO)
- Conducting Touch and Go landings
- Landing altitude is above 10,000 feet pressure altitude
- Landing OAT on the ground is below -40°C or greater than +50°C
- Gross weight is greater than maximum landing weight
- (TALPA) On a dry runway, when the calculated landing distance is based on MAX MANUAL performance data, and the calculated landing distance is within 1,000 feet/305 meters of the landing distance available
- (Non-TALPA) For any runway, when the calculated landing distance is based on MAX MANUAL performance data, and the calculated landing distance is within 2,000 feet/610 meters of the landing distance available.

RUNWAY INHIBIT switch .... INHIBIT

Note: If the RUNWAY INHIBIT switch is in the INHIBIT position, and the airspeed is 250 knots or greater for 60 seconds or more, the RUNWAY INOP light illuminates. The RUNWAY INOP light extinguishes when airspeed is below 250 knots.

Introduction

Airplane operation in adverse weather conditions may require additional considerations due to the effects of extreme temperatures, precipitation, turbulence and windshear. Procedures in this section supplement normal procedures and should be observed when applicable.

Takeoff - Wet or Contaminated Runway Conditions

The following information applies to takeoffs on wet or contaminated runways:

- For wet runways, reduced thrust (fixed derate, assumed temperature method, or both) is allowed provided suitable takeoff performance accountability is made for the increased stopping distance on a wet surface
- For runways contaminated by slush, snow, standing water, or ice, reduced thrust (fixed derate) is allowed provided takeoff performance accounts for the runway surface condition. Reduced thrust using assumed temperature method, whether alone or in combination with a fixed derate, is not allowed
- V1 may be reduced to minimum V1 to provide increased stopping margin provided the field length required for a continued takeoff from the minimum V1 and obstacle clearance meet the regulatory requirements. The determination of such minimum V1 may require a real-time performance calculation tool or other performance information supplied by dispatch
- Takeoffs are not recommended when slush, wet snow, or standing water depth is more than 1/2 inch (13 mm) or dry snow depth is more than 4 inches (102 mm).

Cold Weather Operations

Considerations associated with cold weather operation are primarily concerned with low temperatures and with ice, snow, slush and standing water on the airplane, ramps, taxiways, and runways.

Icing conditions exist when OAT (on the ground) or TAT (in flight) is 10°C or below and any of the following exist:

- visible moisture (clouds, fog with visibility of one statute mile (1600m) or less, rain, snow, sleet, ice crystals, and so on) is present, or
- ice, snow, slush or standing water is present on the ramps, taxiways, or runways.

CAUTION: Do not use engine or wing anti–ice when OAT (on the ground) or TAT (in flight) is above 10°C.

Exterior Inspection

Although removal of surface snow, ice and frost is normally a maintenance function, during preflight procedures, the captain or first officer should carefully inspect areas where surface snow, ice or frost could change or affect normal system operations.

Do the normal Exterior Inspection with the following additional steps:

Surfaces .... Check

[Option - With Blended Winglets]

Takeoff with light coatings of frost, up to 1/8 inch (3 mm) in thickness, on lower wing surfaces due to cold fuel is allowable; however, all leading edge devices, all control surfaces, tab surfaces, upper wing surfaces, winglet surfaces and control surface balance panel cavities must be free of snow, ice and frost.

[Option - Without Blended Winglets]

Takeoff with light coatings of frost, up to 1/8 inch (3 mm) in thickness, on lower wing surfaces due to cold fuel is allowable; however, all leading edge devices, all control surfaces, tab surfaces, upper wing surfaces and control surface balance panel cavities must be free of snow, ice and frost.

Thin hoarfrost is acceptable on the upper surface of the fuselage provided all vents and ports are clear. Thin hoarfrost is a uniform white deposit of fine crystalline texture, which usually occurs on exposed surfaces on a cold and cloudless night, and which is thin enough to distinguish surface features underneath, such as paint lines, markings or lettering.

Control surface balance panel cavities .... Check

Check drainage after snow removal. Puddled water may freeze in flight.

Pitot probes and static ports .... Check

Verify that all pitot probes and static ports free of snow and ice. Water rundown after snow removal may freeze immediately forward of static ports and cause an ice buildup which disturbs airflow over the static ports resulting in erroneous static readings even when static ports are clear.

Air conditioning inlets and exits .... Check

Verify that the air inlets and exits, including the outflow valve, are free of snow and ice.

If the APU is operating, verify that the outflow valve is fully open.

Engine inlets .... Check

Verify that the inlet cowling is free of snow and ice.

Verify that the fan is free to rotate.

Snow or ice that accumulates on the fan spinner or fan blades during extended shutdown periods must be removed by maintenance or other means before engine start.

Snow or ice that accumulates on the fan spinner or fan blades as a result of operation in icing conditions, such as during approach or taxi in, is allowed if the fan is free to rotate and the snow or ice is removed using the ice shedding procedure during taxi out and before setting takeoff thrust.

Fuel tank vents .... Check

Verify all traces of ice and frost are removed.

Landing gear doors .... Check

Landing gear doors should be free of snow and ice.

APU air inlets .... Check

The APU inlet door and cooling air inlet must be free of snow and ice before APU start.

Preflight Procedure - First Officer

Do the following step after completing the normal Preflight Procedure - First Officer:

PROBE HEAT switches .... ON

Verify that all probe heat lights are extinguished.

Engine Start Procedure

Do the normal Engine Start Procedure with the following modifications:

- If the engine has been cold soaked for one or more hours at ambient temperatures below -40°C, do not start or motor the engine. Maintenance personnel should do appropriate procedures for adverse weather heating of the Hydro-Mechanical Unit.
- If the engine has been cold soaked for three or more hours at ambient temperatures below -40°C, do not start or motor the engine. Maintenance personnel should do appropriate procedures for adverse weather starter servicing.
- If ambient temperature is below -35°C, idle the engine for two minutes before changing thrust lever position.
- Several minutes may be needed for oil pressure to reach the normal operating pressure. During this period, oil pressure may go above the normal range and the OIL FILTER BYPASS light may illuminate. Operate the engine at idle thrust until oil pressure returns to the normal range.
- If the oil pressure remains above the normal range after the oil temperature has stabilized within limits, shut down the engine.
- Display units may require additional warm-up time before displayed engine indications accurately show changing values. Display units may appear less bright than normal.

Engine Anti-ice Operation - On the Ground

Engine anti-ice must be selected ON immediately after both engines are started and remain on during all ground operations when icing conditions exist or are anticipated.

WARNING: Do not rely on airframe visual icing cues before activating engine anti-ice. Use the temperature and visible moisture criteria because late activation of engine anti-ice may allow excessive ingestion of ice and result in engine damage or failure.

CAUTION: Do not use engine anti-ice when OAT is above 10°C.

When engine anti-ice is needed:

[Without automatic ignition]
ENGINE START switches .... CONT F/O

ENGINE ANTI-ICE switches .... ON F/O

Verify that the COWL VALVE OPEN lights illuminate bright, then dim.

Verify that the COWL ANTI-ICE lights are extinguished.

Note: If the COWL VALVE OPEN lights remain illuminated bright with engines at IDLE, do the following:

- verify APU BLEED air switch is in the OFF position,
- verify ISOLATION VALVE switch is in the AUTO position,
- check that the area around the airplane is clear, and
- increase thrust slightly (up to a maximum of 30% N1).

When engine anti-ice is no longer needed:

ENGINE ANTI-ICE switches .... OFF F/O

Verify that the COWL VALVE OPEN lights illuminate bright, then extinguish.

Wing Anti-ice Operation - On the Ground

Use wing anti-ice during all ground operations between engine start and takeoff when icing conditions exist or are anticipated, unless the airplane is, or will be protected by the application of Type II or Type IV fluid in compliance with an approved ground de-icing program.

WARNING: Do not use wing anti-ice as an alternative for ground de-icing/anti-icing. Close inspection is still needed to ensure that no frost, snow or ice is adhering to the wing, leading edge devices, stabilizer, control surfaces or other critical airplane components at takeoff.

CAUTION: Do not use wing anti-ice when OAT is above 10°C.

When wing anti-ice is needed:

WING ANTI-ICE switch .... ON F/O

Verify that the L and R VALVE OPEN lights illuminate bright, then dim.

Note: The wing anti-ice VALVE OPEN lights may cycle bright/dim due to the control valves cycling closed/open in response to thrust setting and duct temperature logic.

When wing anti-ice is no longer needed:

WING ANTI-ICE switch .... OFF F/O

Verify that the L and R VALVE OPEN lights illuminate bright, then extinguish.

Before Taxi Procedure

Do the normal Before Taxi Procedure with the following modifications:

GENERATOR 1 and 2 switches .... ON F/O

Normally the IDG's stabilize within one minute, although due to cold oil, up to five minutes can be needed to produce steady power.

If there is snow or ice accumulation on the wing, consider delaying the flight control check until after de-icing/anti-icing is accomplished.

Flight controls .... Check C

An increase in control forces can be expected at low temperatures.

CAUTION: The flap position indicator and the leading edge devices annunciator panel should be closely observed for positive movement. If the flaps should stop, the flap lever should be placed immediately in the same position as indicated.

Flaps .... Check F/O

Move the flaps from Flaps up to Flaps 40 back to Flaps up (i.e., full travel) to ensure freedom of movement.

If taxi route is through ice, snow, slush or standing water in low temperatures or if precipitation is falling with temperatures below freezing, taxi out with the flaps up. Taxiing with the flaps extended subjects the flaps and flap drives to contamination. Leading edge devices are also susceptible to slush accumulations.

Call "FLAPS ___" as needed. C

Flap lever... Set flaps, as needed F/O

Taxi–Out

CAUTION: Taxi at a reduced speed. Use smaller nose wheel steering wheel and rudder inputs and apply minimum thrust smoothly. Differential thrust may be used to help maintain airplane momentum during turns. At all other times, apply thrust evenly. Taxiing on slippery taxiways or runways at excessive speed or with high crosswinds may start a skid.

CAUTION: When operating the engines over significant amounts of standing de-icing or anti-icing fluid, limit thrust to the minimum required. Excessive ingestion of de-icing or anti-icing fluid can cause the fluid to build up on the engine compressor blades resulting in compressor stalls and engine surges.

When engine anti-ice is required and the OAT is 3°C or below, an engine run up is recommended to minimize ice build-up. Use the following procedure:

Check that the area behind the airplane is clear.	PF
Run-up to a minimum of 70% N1 for approximately 30 seconds duration at intervals no greater than 30 minutes.	PF

Note: Fan blade ice build-up is cumulative. If the fan spinner and fan blades were not deiced prior to taxi out, the time the engines were operating during the taxi in should be included in the 30 minute interval.

If airport surface conditions and the concentration of aircraft do not allow the engine thrust level to be increased to 70% N1, then set a thrust level as high as practical and time at that thrust level.	PF

Note: When operating in conditions of freezing rain, freezing drizzle, freezing fog or heavy snow, run-ups to a minimum of 70% N1 for approximately 1 second duration at intervals no greater than 10 minutes enhance ice shedding.

De-icing/Anti-icing

Testing of undiluted de-icing/anti-icing fluids has shown that some of the fluid remains on the wing during takeoff rotation and initial climb. The residual fluid causes a temporary decrease in lift and increase in drag, however, the effects are temporary. Use the normal takeoff rotation rate.

CAUTION: Operate the APU during de-icing only if necessary. If the APU is running, ingestion of de-icing fluid causes objectionable fumes and odors to enter the airplane. Ingestion of snow, slush, ice, or de-icing/anti-icing fluid can also cause damage to the APU.

If de-icing/anti-icing is needed:

APU .... As needed F/O

The APU should be shut down unless APU operation is necessary.

Call "FLAPS UP". C

Flaps .... UP F/O

Prevents ice and slush from accumulating in flap cavities during de-icing.

Thrust levers .... Idle C

Reduces the possibility of injury to personnel at inlet or exhaust areas.

WARNING: Ensure that the stabilizer trim wheel handles are stowed before using electric trim to avoid personal injury.

Stabilizer trim .... ___ UNITS C

Set the trim for takeoff.

Verify that the trim is in the green band.

Engine BLEED air switches .... OFF F/O

Reduces the possibility of fumes entering the air conditioning system.

APU BLEED air switch .... OFF F/O

Reduces the possibility of fumes entering the air conditioning system.

After de-icing/anti-icing is completed:

APU .... As needed F/O

CAUTION: After de-icing, the use of APU bleed air during takeoff can cause smoke in the airplane.

APU BLEED air switch .... As needed F/O

Wait approximately one minute after de-icing is completed to turn engine BLEED air switches on to ensure all de-icing fluid has been cleared from the engines:

Engine BLEED air switches .... ON F/O

Flight controls ....Check, as needed C

An increase in control forces can be expected at low temperatures.

[Without PRR 38506 or Service Bulletin 737-55A-1080]
Control column ....Move full forward/full aft C

Slowly cycle the control column full forward to full aft a minimum of 3 times to drain residual fluid from the elevator balance bay.

Before Takeoff Procedure

Do the normal Before Takeoff Procedure with the following modifications:

Call “FLAPS ___” as needed for takeoff. PF

Flap lever .... Set takeoff flaps, as needed PM

Extend the flaps to the takeoff setting at this time if they have been held because of slush, or standing water, or icing conditions, or because of exterior de-icing/anti-icing.

Verify that the LE FLAPS EXT green light is illuminated.

Takeoff Procedure

Do the normal Takeoff Procedure with the following modification:

When engine anti-ice is required and the OAT is 3°C or below, the takeoff must be preceded by a static engine run-up. Use the following procedure:

Run-up to a minimum of 70% N1 and confirm stable engine operation before the start of the takeoff roll. A 30-second run-up is highly recommended whenever possible.

Engine Anti-Ice Operation - In Flight

Engine anti–ice must be ON during all flight operations when icing conditions exist or are anticipated, except during climb and cruise when the temperature is below -40°C SAT. Engine anti–ice must be ON before, and during descent in all icing conditions, including temperatures below -40°C SAT.

When operating in areas of possible icing, activate engine anti–ice before entering icing conditions.

[Option - Without Icing Advisory Light]

WARNING: Do not rely on airframe visual icing cues before activating engine anti–ice. Use the temperature and visible moisture criteria because late activation of engine anti-ice may allow excessive ingestion of ice and result in engine damage or failure.

[Option - With Icing Advisory Light]

WARNING: Do not rely on airframe visual icing cues or illumination of the ICING light before activating engine anti–ice. Use the temperature and visible moisture criteria because late activation of engine anti-ice may allow excessive ingestion of ice and result in engine damage or failure.

CAUTION: Do not use engine anti-ice when TAT is above 10°C

When engine anti-ice is needed:

[Without automatic ignition]
ENGINE START switches .... CONT PM

ENGINE ANTI-ICE switches .... ON PM

Verify that the COWL VALVE OPEN lights illuminate bright, then dim.

Verify that the COWL ANTI-ICE lights are extinguished.

Note: If the COWL VALVE OPEN lights remain illuminated bright with engines at IDLE, do the following:.

- verify APU BLEED air switch is in the OFF position,
- verify ISOLATION VALVE switch is in the AUTO position, and
- increase thrust slightly (up to a minimum of 30% N1).

When engine anti-ice is no longer needed:

ENGINE ANTI-ICE switches ....OFF PM

Verify that the COWL VALVE OPEN lights illuminate bright, then extinguish.

[Without automatic ignition]
ENGINE START switches ....OFF PM

Fan Ice Removal

CAUTION: Avoid prolonged operation in moderate to severe icing conditions.

Prolonged operation in moderate to severe icing conditions can lead to fan blade/spinner icing and engine vibration. Severe icing can usually be avoided by a change in altitude and/or airspeed. If flight in moderate to severe icing conditions cannot be avoided, do the following on both engines, one engine at a time:

Note: Engine vibration can reduce to a low level before 80% N1 is reached, however, thrust increase must continue to a minimum of 80% N1 to remove ice from the fan blades.

Note: Engine vibration can indicate full scale before shedding ice, however, this has no adverse effect on the engine.

ENGINE START switches (both) .... FLT PM

Autothrottle (if engaged) ....Disengage PF

Thrust .... Increase PF

Increase thrust to a minimum of 80% N1 for approximately 1 second to ensure the fan blades and spinner are clear of ice.

Thrust .... Reduce as needed for flight conditions PF

Wait 15 seconds. This allows engine vibration level to stabilize.

If engine vibration is less than 4.0 units after thrust is reduced, repeat the above steps at approximately 15 minute intervals or sooner as needed.

Autothrottle (if needed) ....Engage PF

If engine vibration is 4.0 units or greater after thrust is reduced, do the Engine High Vibration non-normal checklist.

Wing Anti-ice Operation - In Flight

Ice accumulation on the flight deck window frames, windshield center post, or on the windshield wiper arm may be used as an indication of structural icing conditions and the need to turn on wing anti-ice.

In flight, the wing anti-ice system may be used as a de-icer or as an anti-icer. The primary method is to use it as a de-icer by allowing ice to accumulate before turning wing anti-ice on. This procedure provides the cleanest airfoil surface, the least possible runback ice formation, and the least thrust and fuel penalty. Normally it is not necessary to shed ice periodically unless extended flight through icing conditions is necessary (holding).

The secondary method is to use wing anti-ice before ice accumulation. Operate the wing anti-ice system as an anti-icer only during extended operations in moderate or severe icing conditions, such as holding.

CAUTION: Do not use wing anti-ice when TAT is above 10°C.

CAUTION: Use of wing anti-ice above approximately FL350 may cause bleed trip off and possible loss of cabin pressure.

Note: Prolonged operation in icing conditions with the leading edge and trailing edge flaps extended is not recommended. Holding in icing conditions with flaps extended is prohibited.

When wing anti-ice is needed:

WING ANTI-ICE switch .... ON PM

Verify that the L and R VALVE OPEN lights illuminate bright, then dim.

When wing anti-ice is no longer needed:

WING ANTI-ICE switch ....OFF PM

Verify that the L and R VALVE OPEN lights illuminate bright, then extinguish.

Cold Temperature Altitude Corrections

Extremely low temperatures create significant altimeter errors and greater potential for reduced terrain clearance. When the temperature is colder than ISA, true altitude will be lower than indicated altitude. Altimeter errors become significantly larger when the surface temperature approaches -30°C or colder, and also become larger with increasing height above the altimeter reference source.

[Option - Temperature Compensation Available with U14 and newer]
For additional information on temperature corrections to approach altitudes refer to Temperature Compensation for Approach Altitudes in Supplementary Procedure (SP 11).

Apply the altitude correction table when needed:

- apply corrections to all published minimum departure, en route and approach altitudes, including missed approach altitudes, according to the table below. Advise ATC of the corrections
- MDA/DA settings should be set at the corrected minimum altitudes for the approach
- corrections apply to QNH and QFE operations.

To determine the correction from the Altitude Correction Table:

- subtract the elevation of the altimeter barometric reference setting source (normally the departure or destination airport elevation) from the published minimum altitude to be flown to determine “height above altimeter reference source”
- enter the table with Airport Temperature and with “height above altimeter reference source”. Read the correction where these two entries intersect. Add the correction to the published minimum altitude to be flown to determine the corrected indicated altitude to be flown. To correct an altitude above the altitude in the last column, use linear extrapolation (e.g., to correct 6000 feet or 1800 meters, use twice the correction for 3000 feet or 900 meters, respectively.) The corrected altitude must always be greater than the published minimum altitude
- if the corrected indicated altitude to be flown is between 100 foot increments, set the MCP altitude to the closest 100 foot increment above the corrected indicated altitude to be flown.
- do not correct altimeter barometric reference settings.

An altitude correction due to cold temperature is not needed for the following conditions:

- While under ATC radar vectors
- When maintaining an ATC assigned flight level (FL)
- When the reported airport temperature is above 0°C or if the airport temperature is at or above the minimum published temperature for the procedure being flown.

Note: Regulatory authorities may have other requirements for cold temperature altitude corrections.

Altitude Correction Table (Heights and Altitudes in Feet)

Airport Temp °C	Height Above Altimeter Reference Source											
	200 feet	300 feet	400 feet	500 feet	600 feet	700 feet	800 feet	900 feet	1000 feet	1500 feet	2000 feet	3000 feet
0°	20	20	30	30	40	40	50	50	60	90	120	170
-10°	20	30	40	50	60	70	80	90	100	150	200	290
-20°	30	50	60	70	90	100	120	130	140	210	280	420
-30°	40	60	80	100	120	140	150	170	190	280	380	570
-40°	50	80	100	120	150	170	190	220	240	360	480	720
-50°	60	90	120	150	180	210	240	270	300	450	590	890

Altitude Correction Table (Heights and Altitudes in Meters)

Airport Temp °C	Height Above Altimeter Reference Source											
	60 m	90 m	120 m	150 m	180 m	210 m	240 m	270 m	300 m	450 m	600 m	900 m
0°	5	5	10	10	10	15	15	15	20	25	35	50
-10°	10	10	15	15	20	20	25	30	30	45	60	90
-20°	10	15	20	25	25	30	35	40	45	65	85	130
-30°	15	20	25	30	35	40	45	55	60	85	115	170
-40°	15	25	30	40	45	50	60	65	75	110	145	220
-50°	20	30	40	45	55	65	75	80	90	135	180	270

Approach and Landing

Use normal procedures and reference speeds.

After Landing Procedure

CAUTION: Taxi at a reduced speed. Use smaller nose wheel steering wheel and rudder inputs and apply minimum thrust smoothly. Differential thrust may be used to help maintain airplane momentum during turns. At all other times, apply thrust evenly. Taxiing on slippery taxiways or runways at excessive speed or with high crosswinds may start a skid.

CAUTION: When operating the engines over significant amounts of standing de-icing or anti-icing fluid, limit thrust to the minimum required. Excessive ingestion of de-icing or anti-icing fluid can cause the fluid to build up on the engine compressor blades resulting in compressor stalls and engine surges.

Do the normal After Landing Procedure with the following modifications:

After prolonged operation in icing conditions with the flaps extended, or when an accumulation of airframe ice is observed, or when operating on a runway or taxiway contaminated with ice, snow, slush or standing water:

Do not retract the flaps to less than flaps 15 until the flap areas have been checked to be free of contaminants.

Engine anti-ice must be selected ON and remain on during all ground operations when icing conditions exist or are anticipated.

WARNING: Do not rely on airframe visual icing cues before activating engine anti-ice. Use the temperature and visible moisture criteria because late activation of engine anti-ice may allow excessive ingestion of ice and result in engine damage or failure.

CAUTION: Do not use engine anti-ice when OAT is above 10°C.

When engine anti-ice is needed:

[Without automatic ignition]
ENGINE START switches .... CONT PM

ENGINE ANTI-ICE switches .... ON PM

Verify that the COWL VALVE OPEN lights illuminate bright, then dim.

Verify that the COWL ANTI-ICE lights are extinguished.

Note: If the COWL VALVE OPEN lights remain illuminated bright with engines at IDLE, do the following:

- verify APU BLEED air switch is in the OFF position,
- verify ISOLATION VALVE switch is in the AUTO position, and
- increase thrust slightly (up to a maximum of 30% N1).

When engine anti-ice is no longer needed:

ENGINE ANTI-ICE switches .... OFF PM

Verify that the COWL VALVE OPEN lights illuminate bright, then extinguish.

[Without automatic ignition]
ENGINE START switches .... OFF PM

When engine anti-ice is required and the OAT is 3°C or below, an engine run up is recommended to minimize ice build-up. Use the following procedure: PF

Check that the area behind the airplane is clear.

Run-up to a minimum of 70% N1 for approximately 30 seconds duration at intervals no greater than 30 minutes.

If airport surface conditions and the concentration of aircraft do not allow the engine thrust level to be increased to 70% N1, then set a thrust level as high as practical and time at that thrust level.

Note: When operating in conditions of freezing rain, freezing drizzle, freezing fog or heavy snow, run-ups to a minimum of 70% N1 for approximately 1 second duration at intervals no greater than 10 minutes should be considered.

Shutdown Procedure

Do the following step before starting the normal Shutdown Procedure:

After landing in icing conditions:

WARNING: Ensure that the stabilizer trim wheel handles are stowed before using electric trim to avoid personal injury.

Stabilizer trim .... Set 5 units C

Prevents melting snow and ice from running into the tailcone. Excessive water in the tailcone can freeze and lock controls.

Secure Procedure

Do the normal Secure Procedure with the following modifications:

If the airplane will be attended and warm air circulation throughout the cargo E/E compartments is desired:

CAUTION: Do not leave the interior unattended with a pack operating and all doors closed. With the airplane in this configuration, accidental closure of the main outflow valve can cause unscheduled pressurization of the airplane.

APU	Start	F/O
APU GENERATOR bus switches	ON	F/O
PACK switches	AUTO	F/O
ISOLATION VALVE switch	OPEN	F/O
Pressurization mode selector	MAN	F/O
Outflow valve switch	OPEN	F/O

Prevents aircraft pressurization.

Note: The airplane must be parked into the wind when the outflow valve is full open.

APU BLEED air switch	ON	F/O

If the airplane will not be attended, or if staying overnight at off-line stations or at airports where normal support is not available, the flight crew must arrange for or verify that the following steps are done:

Pressurization mode selector	MAN	F/O
Outflow valve	CLOSE	F/O

Position the outflow valve fully closed to inhibit the intake of snow or ice.

Wheel chocks	Verify in place	C or F/O
Parking brake	Released	C

Reduces the possibility of frozen brakes.

Cold weather maintenance procedures for securing the airplane may be required. These procedures are normally done by maintenance personnel, and include, but are not limited to:

- protective covers and plugs installed
- water storage containers drained
- toilets drained
- doors and sliding windows closed

[Option - Single battery]

- battery removed. If the battery will be exposed to temperatures below -18°C, the battery should be removed and stored in an area warmer than -18°C, but below 40°C. Subsequent installation of the warm battery ensures the starting capability of the APU.

[Option - Dual battery]

- batteries removed. If the batteries will be exposed to temperatures below -18°C, the batteries should be removed and stored in an area warmer than -18°C, but below 40°C. Subsequent installation of the warm batteries ensures the starting capability of the APU.

Hot Weather Operation

During ground operation the following considerations will help keep the airplane as cool as possible:

- While the airplane is electrically powered, packs should be run or cooling air supplied to the airplane when the OAT exceeds 40° C (103° F) to protect the reliability of electrical and electronic equipment in the airplane.
- If cooling air is available from an outside source, the supply should be plugged in immediately after engine shutdown and should not be removed until just prior to engine start.
- Keep all doors and windows, including cargo doors, closed as much as possible.
- Electronic components which contribute to a high temperature level in the flight deck should be turned off while not needed.

[Passenger Airplanes]

- Open all passenger cabin gasper outlets and close all window shades on the sun–exposed side of the passenger cabin.

Note: If only cooling air from a ground air conditioning cart is supplied (no pressurized air from the APU or ground external air), then the TAT probes are not aspirated. Because of high TAT probe temperatures, the FMC’s may not accept an assumed temperature derate. Delay selecting an assumed temperature derate until after bleed air is available.

If these actions do not reduce cabin temperatures sufficiently:

PASSENGER CABIN temperature selector .... AUTO COOL

PACK switches .... HIGH

[737-600/700]
If the cabin temperature remains high:

PASSENGER CABIN temperature selector ....MAN COOL

After engine start with the engines at ground idle, the pneumatic pressure available to the bleed air system may not be sufficient to provide adequate cooling during extended ground operations. Use of APU bleed air instead of engine bleed air to supply the packs while on the ground can significantly increase cabin cooling. If additional cooling is needed during extended ground operations:

Engine BLEED 1 air switch .... OFF

Engine BLEED 2 air switch .... OFF

ISOLATION VALVE switch .... OPEN

APU BLEED air switch ....ON

PACK switches .... HIGH

Temperature selectors ....AUTO COOL

Prior to takeoff:

PACK switches .... AUTO

Engine BLEED 2 air switch ....ON

APU BLEED air switch .... OFF

Engine BLEED 1 air switch ....ON

ISOLATION VALVE switch .... AUTO

Temperature selectors ....As needed

Brake temperature levels may be reached which can cause the wheel fuse plugs to melt and deflate the tires. Consider the following actions:

- Be aware of brake temperature buildup when operating a series of short flight sectors. The energy absorbed by the brakes from each landing is accumulative
- Extending the landing gear early during the approach provides additional cooling for tires and brakes.
- In–flight cooling time can be determined from the “Brake Cooling Schedule” in the Performance–Inflight section of the QRH.

During flight planning consider the following:

- High temperatures inflict performance penalties which must be taken into account on the ground before takeoff
- Alternate takeoff procedures (No Engine Bleed Takeoff, Improved Climb Performance, etc.)

Moderate to Heavy Rain, Hail or Sleet

Flights should be conducted to avoid thunderstorm or hail activity. If visible moisture is present at high altitude, avoid flight over the storm cell. (Storm cells that do not produce visible moisture at high altitude can be overflown safely.) To the maximum extent possible, moderate to heavy rain, hail or sleet should also be avoided.

If moderate to heavy rain, hail or sleet is encountered or anticipated:

ENGINE START switches .... CONT

Autothrottle .... Disengage

Thrust Levers .... Adjust Slowly

If thrust changes are necessary, move the thrust levers slowly. Avoid changing thrust lever direction until engines have stabilized at a selected setting. Maintain an increased minimum thrust setting.

IAS/MACH .... Use a slower speed

Using a slower speed improves engine tolerance to heavy precipitation intake.

Consider starting the APU (if available).

Operation in a Sandy or Dusty Environment

The main hazards of a sandy or dusty environment are erosion (especially of engine fan blades), accumulation of sand or dust on critical surfaces and blockage. The effects of sand ingestion occur predominantly during takeoff, landing and taxi operations. The adverse effects, however, can occur if the airplane’s flight path was through a cloud of visible sand or dust or the airplane was parked during a sand or dust storm. Premature engine deterioration can result from sand or dust ingestion, causing increased fuel burn and reduced EGT margins.

CAUTION: After a sandstorm, if all taxiways and runways are not carefully inspected and swept for debris before flight ops are conducted, the risk of engine damage and wear is increased.

Exterior Inspection

Although removal of sand and dust contaminants is primarily a maintenance function, during the exterior inspection the captain or first officer should carefully inspect areas where accumulation of sand or dust could change or affect normal system operations.

Do the normal Exterior Inspection with the following additional steps:

Windshield .... Check

Verify that the windshield has been cleaned.

Note: Do not use windshield wipers for sand or dust removal. Wash deposits off with water and wipe residue off with a soft cloth.

Surfaces .... Check

Verify that the upper surfaces of the wings and other control surfaces are free of sand.

CAUTION: Particular care should be taken to ensure that the fuselage and all surfaces are clean after a sand storm that occurs with a rain storm.

Probes, sensors, ports, ram turbine doors,
vents, and drains (as applicable) .... Check

Verify that the left and right ram air inlets are free of sand and dust. Verify that the cabin pressure outflow valve and both positive pressure relief valves are free of sand and dust.

Leading edge flaps .... Check

Verify that all leading edges are undamaged.

Engine inlets .... Check

Verify that the inlet cowling is free of sand and dust.

Verify that the fan is free to rotate and fan blades are undamaged.

Fuel tank vents .... Check

Verify that all vents are free of sand and dust.

Landing gear .... Check

Verify that gear struts and doors are free of sand and dust build-up.

Vertical and horizontal stabilizers .... Check

Verify that all leading edges are undamaged.

APU air inlets .... Check

Ensure that the APU inlet door and cooling air inlet are free of sand and dust before APU start.

Preflight Procedure - First Officer

Do the normal Preflight Procedure - First Officer with the following modifications:

Note: Minimize the use of air conditioning, other than from a ground air conditioner, as much as possible. If the APU must be used for air conditioning, maintain a temperature as high as possible while still providing a tolerable flight deck and cabin environment.

APU BLEED air switch .... OFF F/O

If APU bleed air will be used and the APU is not operating:

APU switch .... START F/O

Note: Run the APU for two full minutes before using it as a bleed air source.

Engine BLEED air switches .... OFF F/O

APU BLEED air switch .... ON F/O

Engine Start Procedure

Do the normal Engine Start Procedure with the following modifications:

Note: Use a filtered ground cart for pneumatic air for engine start, if available.

ENGINE START switch .... GRD F/O

Verify that the N2 RPM increases. C, F/O

Motor the engine for 2 minutes to help remove contaminants.

[Option - Fuel Control Switches]

CAUTION: Do not apply rotational force when moving the engine start lever.

Engine start lever .... IDLE detent C

Before Taxi Procedure

Do the normal Before Taxi Procedure with special emphasis on the following steps:

If bleed air is needed to maintain tolerable flight deck and cabin temperatures, use APU bleed air rather than engine bleed air during the taxi out. Limit APU bleed air use as much as possible to reduce sand and dust ingestion.

If APU bleed air will be used and the APU is not operating:

APU switch ....START F/O

Note: Run the APU for two full minutes before using it as a bleed air source.

Engine BLEED air switches .... OFF F/O

APU BLEED air switch .... ON F/O

Flight controls ....Check C

Verify that there is no increase in control forces due to sand or dust contaminants.

Taxi–Out

Do the following, conditions permitting, to minimize sand and dust ingestion by the engines and to improve visibility during taxi:

- Use all engines during taxi and taxi at low speed. Limit ground speed to 10 knots and maintain thrust below 40% N1 whenever possible to avoid creating engine vortices during ground operations.
- Maintain a greater than normal separation from other aircraft while taxiing and avoid the ingestion of another engine's wake.
- Avoid engine overhang of unprepared surfaces.
- In the event of a crosswind during 180° turns, turn away from the wind if possible to minimize sand and dust ingestion.

- Whenever possible, avoid situations that would require the airplane to be brought to a complete stop.
- Avoid excessive braking. The presence of sand or dust will increase brake wear.

Takeoff

Do the following to minimize sand and dust ingestion by the engines during takeoff:

- Use the maximum fixed derate and/or assumed temperature thrust reduction that meets performance requirements.

[Option]
- Avoid the use of "bump thrust".
- Make an No Engine Bleed Takeoff if operations permit. If cabin and flight deck temperatures can be maintained at a tolerable temperature, consider an Unpressurized Takeoff.
- Before takeoff, allow sand and dust to settle if conditions allow.
- Do not take off into a sand or dust cloud.
- Use a rolling takeoff. Whenever possible, avoid setting high thrust at low speed.
- When visible sand and dust exist, consider delaying flap retraction until above the dust cloud, if operations permit.

Approach

Do the following, conditions permitting, to minimize sand and dust ingestion:

- Make an No Engine Bleed Landing if operations permit. If cabin and flight deck temperatures can be maintained at a tolerable temperature, consider an Unpressurized Landing.

Landing

Do the following to minimize sand and dust ingestion by the engines during landing:

- Use autobrakes on landing to help minimize the need for reverse thrust.
- Performance permitting, minimize the use of reverse thrust to prevent ingestion of dust and sand and to prevent reduction of visibility. Reverse thrust is most effective at high speed.

After Landing Procedure

Do the normal After Landing Procedure with the following modifications:

If bleed air is needed to maintain tolerable flight deck and cabin temperatures, use APU bleed air rather than engine bleed air during the taxi in. Limit APU bleed air use as much as possible to reduce sand and dust ingestion.

If APU bleed air will be used and the APU is not operating:

APU switch ....START PM

Note: Run the APU for two full minutes before using it as a bleed air source.

Engine BLEED air switches .... OFF PM

APU BLEED air switch .... ON PM

Taxi-In

Do the following, conditions permitting, to minimize sand and dust ingestion by the engines and to improve visibility during the taxi-in:

- Use all engines and taxi at low speed. Limit ground speed to 10 knots and maintain thrust below 40% N1 whenever possible.
- Maintain a greater than normal separation from other aircraft while taxiing and avoid the ingestion of another engine's wake.
- Avoid engine overhang of unprepared surfaces.
- In the event of a crosswind during 180° turns, turn away from the wind if possible to minimize sand and dust ingestion.
- Whenever possible, avoid situations that would require the airplane to be brought to a complete stop.
- Avoid excessive braking. The presence of sand or dust will increase brake wear.

Secure Procedure

Do the normal Secure Procedure with the following modifications:

CAUTION: Do not leave the interior unattended with a pack operating and all doors closed. With the main outflow valve closed, an unscheduled pressurization of the airplane may occur.

PACK switches ....Verify OFF F/O

Pressurization mode selector ....MAN F/O

Outflow VALVE switch .... CLOSE F/O

Position the outflow valve fully closed to inhibit the intake of sand or dust.

Additional procedures for securing the airplane during sandy or dusty conditions may be needed. These procedures are normally done by maintenance personnel, and include, but are not limited to:

- engine covers installed, if applicable.
- protective covers and plugs installed (streamers should be used to remind personnel to remove before flight).
- doors and sliding windows closed.
- all compartments closed.

Turbulence

During flight in light to moderate turbulence, the autopilot and/or autothrottle may remain engaged unless performance is objectionable. Increased thrust lever activity can be expected when encountering wind, temperature changes and large pressure changes. Brief airspeed excursions of 10 to 15 knots can be expected.

Passenger signs .... ON

[Passenger Airplanes]

Advise passengers to fasten seat belts prior to entering areas of reported or anticipated turbulence. Instruct the cabin crew to check that all passengers' seat belts are fastened.

[Freighter Airplanes]

Advise supernumeraries to fasten seat belts prior to entering areas of reported or anticipated turbulence.

Severe Turbulence

Yaw Damper .... ON

Autothrottle .... Disengage

AUTOPILOT .... CWS

A/P status annunciators display CWS for pitch and roll.

Note: If sustained trimming occurs, disengage the autopilot.

ENGINE START switches .... FLT

Thrust .... Set

Set thrust as needed for the phase of flight. Change thrust setting only if needed to modify an unacceptable speed trend.

PHASE OF FLIGHT	AIRSPEED
CLIMB	280 knots or .76 Mach whichever is lower.
CRUISE	Use FMC recommended thrust settings. If the FMC is inoperative, refer to the Unreliable Airspeed page in the Performance–Inflight section of the QRH for approximate N1 settings that maintain near optimum penetration airspeed.
DESCENT	.76 Mach/280/250 knots whichever is lower. If severe turbulence is encountered at altitudes below 15,000 feet and the airplane gross weight is less than the maximum landing weight, the airplane may be slowed to 250 knots in the clean configuration.

Note: If an approach must be made into an area of severe turbulence, delay flap extension as long as possible. The airplane can withstand higher gust loads in the clean configuration.

Windshear

Windshear is a change of wind speed and/or direction over a short distance along the flight path. Indications of windshear are listed in the Windshear non-normal maneuver in this manual.

Avoidance

The flight crew should search for any clues to the presence of windshear along the intended flight path. Presence of windshear may be indicated by:

- Thunderstorm activity
- Virga (rain that evaporates before reaching the ground)
- Pilot reports
- Low level windshear alerting system (LLWAS) warnings.

Stay clear of thunderstorm cells and heavy precipitation and areas of known windshear. If the presence of windshear is confirmed, delay takeoff or do not continue an approach.

Precautions

If windshear is suspected, be especially alert to any of the danger signals and be prepared for the possibility of an inadvertent encounter. The following precautionary actions are recommended if windshear is suspected:

Takeoff

- Takeoff with full rated takeoff thrust is recommended, unless the use of a fixed derate is required to meet a dispatch performance requirement
- For optimum takeoff performance, use flaps 5, 10 or 15 unless limited by obstacle clearance and/or climb gradient
- Use the longest suitable runway provided it is clear of areas of known windshear
- Consider increasing Vr speed to the performance limited gross weight rotation speed, not to exceed actual gross weight Vr + 20 knots. Set V speeds for the actual gross weight. Rotate at the adjusted (higher) rotation speed. This increased rotation speed results in an increased stall margin and meets takeoff performance requirements. If windshear is encountered at or beyond the actual gross weight Vr, do not attempt to accelerate to the increased Vr but rotate without hesitation
- Be alert for any airspeed fluctuations during takeoff and initial climb. Such fluctuations may be the first indication of windshear
- Know the all–engine initial climb pitch attitude. Rotate at the normal rate to this attitude for all non–engine failure takeoffs. Minimize reductions from the initial climb pitch attitude until terrain and obstruction clearance is assured, unless stick shaker activates
- Crew coordination and awareness are very important. Develop an awareness of normal values of airspeed, attitude, vertical speed, and airspeed buildup. Closely monitor vertical flight path instruments such as vertical speed and altimeters. The pilot monitoring should be especially aware of vertical flight path instruments and call out any deviations from normal
- Should airspeed fall below the trim airspeed, unusual control column forces may be required to maintain the desired pitch attitude. If stick shaker is encountered, reduce pitch attitude. Do not exceed the Pitch Limit Indication.

Approach and Landing

- Use flaps 30 for landing
- Establish a stabilized approach no lower than 1000 feet above the airport to improve windshear recognition capability
- Use the most suitable runway that avoids the areas of suspected windshear and is compatible with crosswind or tailwind limitations. Use electronic or visual glide path indications to detect flight path deviations and help with timely detection of windshear
- If the autothrottle is disengaged, or is planned to be disengaged prior to landing, add an appropriate airspeed correction (correction applied in the same manner as gust), up to a maximum of 15 knots

- Avoid large thrust reductions or trim changes in response to sudden airspeed increases as these may be followed by airspeed decreases
- Crosscheck flight director commands using vertical flight path instruments
- Crew coordination and awareness are very important, particularly at night or in marginal weather conditions. Closely monitor the vertical flight path instruments such as vertical speed, altimeters, and glideslope displacement. The pilot monitoring should call out any deviations from normal. Use of the autopilot and autothrottle for the approach may provide more monitoring and recognition time.

Recovery

Accomplish the Windshear Escape Maneuver found in the Non–Normal Maneuvers section of the QRH.

Ice Crystal Icing (ICI)

At temperatures below freezing near convective weather, the airplane can encounter visible moisture made up of high concentrations of small ice crystals. Ice crystals can accumulate aft of the engine fan in the engine core. Ice shedding can cause engine vibration, engine power loss and engine damage. CFM56-7 engines have experienced several power loss events resulting from ice accumulation in the engine.

Ice crystals can also accumulate in the fan hub. This can cause vibration indications above 4 units. Fan ice removal procedures have no effect on fan hub icing. When clear of clouds, fan hub ice sublimates and engine vibration decreases over time. Fan hub ice can remain into descent.

Ice crystal icing is difficult to detect because ice crystals do not cause significant weather radar returns. They are often found in high concentrations above and near regions of heavy precipitation. Ice crystals do not stick to cold airplane surfaces.

Avoid ICI conditions. Flight in clouds containing high concentrations of ice crystals has been associated with engine vibration, engine power loss and engine damage.

Because these conditions can be difficult to recognize, careful preflight planning is a key component of in–flight situational awareness. When ICI is encountered or suspected, do the QRH Ice Crystal Icing NNC to mitigate the effect on the flight.

Recognizing Ice Crystal Icing

Ice crystals are most frequently found in areas of visible moisture and above altitudes normally associated with icing conditions. Their presence can be indicated by one or more of the following:

- appearance of rain on the windshield at temperatures too cold for liquid water to exist. This is due to ice crystals melting on the heated windows (sounds different than rain)
- Areas of light to moderate turbulence
- In IMC with:
  - No significant airframe icing and
  - no significant radar returns at airplane altitude and
  - heavy precipitation below the airplane, identified by amber and red radar returns on the weather radar.
- cloud tops above typical cruise levels (above the tropopause).
- Smell of ozone or sulfur
- Humidity increase
- Static discharge around the windshield (St. Elmo’s fire)

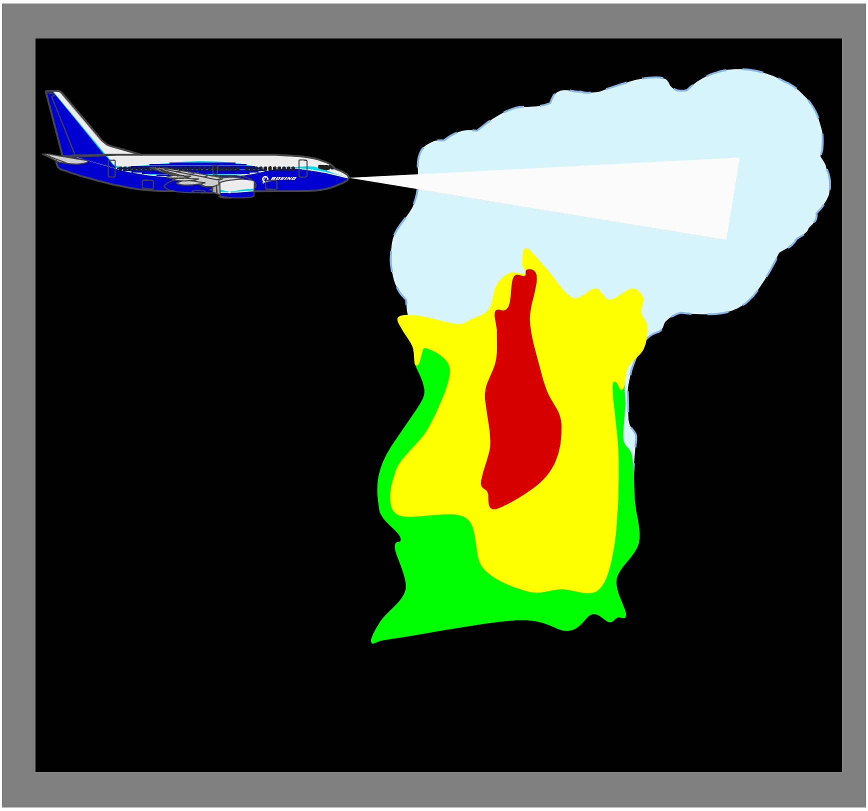
[Airplanes with ice detection]

Note: The ice detection system does not detect ice crystal icing. It is designed to detect supercooled water only.

Avoiding Ice Crystal Icing

During flight in IMC, avoid flying directly over significant amber or red radar returns, even if there are no returns at airplane altitude.

Use the weather radar controls to assess weather radar reflectivity below the airplane flight path. Refer to weather radar operating instructions for additional information.



Areas with a higher risk of High Ice Water Content (HIWC) are identified by some aviation weather vendors. In these areas, ICI should be suspected while operating in IMC. Use of this type of HIWC information is recommended for strategic preflight planning and in–flight adjustments in order to avoid potential ICI conditions.

Ice Crystal Icing Suspected

If conditions allow, exit the ice crystal icing conditions laterally. Climbing or descending to exit ice crystal icing conditions is not recommended. Request a route change to minimize the time above red and amber radar returns.

Do the Ice Crystal Icing non-normal checklist.

Performance Dispatch — Chapter PD
Table of Contents — Section 10

737-600 CFM56-7B22 KG FAA CATD

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

With engine bleed for packs off, increase field limit weight by 550 kg and climb limit weight by 1300 kg.
With engine anti-ice on, decrease field limit weight by 150 kg and climb limit weight by 200 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 600 kg and climb limit weight by 1050 kg.

With engine bleed for packs off, increase weight by 1000 kg.
With engine anti-ice on, decrease weight by 250 kg.
With engine and wing anti-ice on, decrease weight by 1150 kg (optional system).

With engine bleed for packs off, increase weight by 1050 kg.
With engine anti-ice on, decrease weight by 200 kg.
With engine and wing anti-ice on, decrease weight by 800 kg.
When operating in icing conditions during any part of the flight with forecast landing temperature below 10°C, decrease weight by 4550 kg.

**Increase weight by 650 kg per 1% uphill slope. Decrease weight by 950 kg per 1% downhill slope.
Increase weight by 1800 kg per 10 knots headwind. Decrease weight by 6350 kg per 10 knots tailwind.
After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 62 minutes and check that wheel thermal plugs have not melted before executing a subsequent takeoff.**

The following procedure is only applicable to steel brakes,

As an alternate procedure, ensure that each brake pressure plate temperature, without artificial cooling, is less than 218°C as follows:

No sooner than 10 and no later than 15 minutes after parking, measure each brake pressure plate surface temperature at a minimum of two points per brake by an accurate method (using a Doric Microtemp 450 hand held thermometer or equivalent, hold temperature probe in place for 20 seconds or until reading stabilizes). If each measured temperature is less than 218°C, immediate dispatch is allowed; otherwise the required minimum ground wait period of 62 minutes applies.

The following procedure is applicable to steel and carbon brakes, if a Brake Temperature Monitoring System (BTMS) is installed:

**No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 62 minutes after landing, or until all the BTMS readings on the systems Display are below 3.5 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.**

Performance Dispatch — Chapter PD
Gear Down — Section 13

GEAR DOWN

Gear Down

TO BE SUPPLIED

Intentionally
Blank

Introduction

This chapter contains self dispatch performance data intended primarily for use by flight crews in the event that information cannot be obtained from the airline dispatch office. The takeoff data provided is for a single takeoff flap at max takeoff thrust. The range of conditions covered is limited to those normally encountered in airline operation. In the event of conflict between the data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

Takeoff

The maximum allowable takeoff weight will be the least of the Field, Climb, Obstacle, Brake Energy and Tire Speed Limit Weights as determined from the tables shown.

Brake Energy or Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Field Limit Weight - Slope and Wind Corrections

These tables for dry and wet runways provide corrections to the field length available for the effects of runway slope and wind component along the runway. Enter the appropriate table with the available field length and runway slope to determine the slope corrected field length. Next enter the appropriate table with slope corrected field length and wind component to determine the slope and wind corrected field length.

Field and Climb Limit Weight

Tables are presented for selected airport pressure altitudes and runway conditions and show both Field and Climb Limit Weights. Enter the appropriate table for pressure altitude and runway condition with “Slope and Wind Corrected Field Length” determined above and airport OAT to obtain Field Limit Weight. Also read Climb Limit Weight for the same OAT. Intermediate altitudes may be interpolated or use next higher altitude. When finding a maximum weight for a wet runway, the dry runway limit weight must also be determined and the lower of the two weights used.

Obstacle Limit Weight

The Reference Obstacle Limit Weight table provides obstacle limit weights for reference airport conditions based on obstacle height above the runway surface and distance from brake release. Enter the adjustment tables to adjust the reference Obstacle Limit Weight for the effects of OAT, pressure altitude and wind as indicated. In the case of multiple obstacles, enter the tables successively with each obstacle and determine the most limiting weight.

Tire Speed Limit

Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Maximum tire speed limited weights are presented for 225 MPH tires. To determine the tire speed limit weight, enter the table with OAT and airport pressure altitude. Adjust the tire speed limit weight according to the notes below the table to account for wind.

Brake Energy Limit VMBE

Brake Energy Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

The Maximum Brake Energy Speed table provides the Reference VMBE for a variety of airport pressure altitudes and temperatures. Enter the Weight Adjusted VMBE table to adjust the Reference VMBE for the actual brake release gross weight. Correct VMBE for slope and wind. If V1 exceeds VMBE, decrease brake release weight as indicated for each knot that V1 exceeds VMBE and determine V1, VR, and V2 for the lower brake release weight.

Enroute

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. Note that this table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Trip Fuel and Time

Long Range Cruise Trip Fuel and Time tables are provided to determine trip time and fuel required to destination.

To determine trip fuel and time for a constant altitude cruise, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the planned landing weight to obtain the adjustment to the fuel required at the planned landing weight.

Long Range Cruise Step Climb Trip Fuel and Time

The Long Range Cruise Step Climb Trip Fuel and Time tables are provided to determine trip time and fuel required to destination when flying a step climb profile. Step climb profiles are based on 4000 ft step climbs to keep the flight within 2000 ft of the optimum altitude for the current cruise weight. To determine trip fuel and time, enter the Ground to Air Miles Conversion table and determine air distance as discussed above. Then enter the Trip Fuel and Time Required table with air distance and planned landing weight to read trip fuel. Continue across the table to read trip time.

Short Trip Fuel and Time

These tables are provided to determine trip fuel and time for short distances or alternates. Obtain air distance from the table using the ground distance and wind component to the alternate. Enter the Trip Fuel and Time Required table with air distance and read trip fuel required for the expected landing weight, together with time to alternate at right. For distances greater than shown or other altitudes, use the Long Range Cruise Trip Fuel and Time tables.

Holding Planning

This table provides total fuel flow information necessary for planning flaps up holding and reserve fuel requirements. Data is based on the FMC holding speed schedule which is the higher of the maximum endurance and flaps up maneuver speeds. As noted, the fuel flow is based on flight in a racetrack holding pattern. For holding in straight and level flight, reduce table values by 5%.

Flight Crew Oxygen Requirements

This airplane is equipped with a chemical passenger oxygen system. Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. The oxygen quantity associated with the above requirements is achieved with the minimum dispatch oxygen cylinder pressure.

To determine the minimum dispatch oxygen cylinder pressure enter the appropriate flight crew oxygen table with the number of crew plus observers using oxygen and read the minimum cylinder pressure required for the appropriate cylinder temperature.

Net Level Off Weight

The Net Level Off Weight table is provided to determine terrain clearance capability in straight and level flight following an engine failure. Regulations require terrain clearance planning based on net performance which is the gross (or actual) gradient performance degraded by 1.1%. In addition, the net level off pressure altitude must clear the terrain by 1000 ft.

To determine the maximum weight for terrain clearance, enter the table with required net level off pressure altitude and expected ISA deviation to obtain weight. Adjust weight for anti-ice operation as noted below the table.

Landing

Tables are provided for determining the maximum landing weight as limited by field length or climb requirements for a single landing flap.

Maximum landing weight is the lowest of the field length limit weight, climb limit weight, or maximum certified landing weight.

Landing Field Limit Weight

For the expected runway condition and anti-skid system configuration, obtain wind corrected field length by entering the Wind Corrected Field Length table with field length available and wind component along the runway. Now enter the Field Limit Weight table with wind corrected field length and pressure altitude to read field limit weight.

Landing Climb Limit Weight

Enter the table with airport OAT and pressure altitude to read landing climb limit weight. Apply the noted adjustments as required.

Go-Around Climb Gradient

Enter the Reference Go-Around Gradient table with airport OAT and pressure altitude to determine the reference go-around gradient. Then adjust the reference gradient for airplane weight and speed using the tables provided to determine the weight and speed adjusted go-around gradient. Apply the necessary corrections for engine bleed configuration and icing conditions as noted.

Quick Turnaround Limit Weight

Enter the appropriate table (Steel or Carbon Brakes) with airport pressure altitude and OAT to read maximum quick turnaround weight. Apply the noted adjustments as required.

If the landing weight exceeds the maximum quick turnaround weight, wait the specified time and then check that the wheel thermal plugs have not melted before executing a subsequent takeoff. For Steel Brakes, the alternate procedures on the charts can be used to ensure the brake temperature is within limits. These procedures cannot be used for carbon brakes.

Gear Down

This section provides flight planning data for revenue operation with gear down. Unless otherwise noted, the gear down tables in this section are identical in format and usage to the corresponding gear up tables previously described.

To eliminate erroneous displays the flight crew should enter only gross weight data on the PERF INIT page of the Control Display Unit (CDU). Omission of the cost index and cruise altitude entries on the PERF INIT page will render the VNAV function unavailable during flight. As a result, the following information will not be provided: VNAV guidance and speed schedules, trip fuel and ETA predictions, optimum and maximum altitude data, step climb and top of descent predictions, and the VNAV descent guidance path.

The gross weight entry allows the FMCS takeoff and approach speed schedules to be generated. In addition, the flap maneuver speed and VREF speed bugs will be available for display on the primary flight display speed tape. Except for VNAV, normal autopilot and autothrottle modes will remain available for use during the flight, as will the LNAV mode.

Takeoff/Landing Climb Limit Weight

Enter the appropriate table with airport OAT and pressure altitude to determine Takeoff/Landing Climb Limit Weight with gear down. Correct the weight obtained for engine bleed configuration as required.

Performance Dispatch Chapter PD
Pkg Model Identification Section 20

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

With engine bleed for packs off, increase weight by 2600 lb.
With engine anti-ice on, decrease weight by 500 lb.
With engine and wing anti-ice on, decrease weight by 1600 lb.
When operating in icing conditions during any part of the flight with forecast landing temperature below 10°C, decrease weight by 10900 lb.

0	180.0	180.0	180.0	174.3	167.0	159.7
-5	180.0	180.0	180.0	175.9	168.7	161.3
-10	180.0	180.0	180.0	177.5	170.4	162.9
-15	180.0	180.0	180.0	179.2	172.1	164.6
-20	180.0	180.0	180.0	180.0	173.8	166.3
-30	180.0	180.0	180.0	180.0	177.3	170.0
-40	180.0	180.0	180.0	180.0	180.0	173.6
-50	180.0	180.0	180.0	180.0	180.0	177.4

Increase weight by 1700 lb per 1% uphill slope. Decrease weight by 2300 lb per 1% downhill slope.
Increase weight by 4100 lb per 10 knots headwind. Decrease weight by 15100 lb per 10 knots tailwind.
After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 67 minutes and check that wheel thermal plugs have not melted before executing a subsequent takeoff.

As an alternate procedure, ensure that each brake pressure plate temperature, without artificial cooling, is less than 425°F as follows:
No sooner than 10 and no later than 15 minutes after parking, measure each brake pressure plate surface temperature at a minimum of two points per brake by an accurate method (using a Doric Microtemp 450 hand held thermometer or equivalent, hold temperature probe in place for 20 seconds or until reading stabilizes). If each measured temperature is less than 425°F, immediate dispatch is allowed; otherwise the required minimum ground wait period of 67 minutes applies.

If a Brake Temperature Monitoring System (BTMS) is installed:

No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 67 minutes after landing, or until all the BTMS readings on the Systems Display are below 3.5 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.

Quick Turnaround Limit Weight - Category M Carbon Brakes

Flaps 40

-54	-65	189.9	189.9	187.4	180.2	173.1	165.7

Increase weight by 1500 lb per 1% uphill slope. Decrease weight by 2500 lb per 1% downhill slope.
Increase weight by 3700 lb per 10 knots headwind. Decrease weight by 17400 lb per 10 knots tailwind.
After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 48 minutes and check that wheel thermal plugs have not melted before executing a takeoff.

If a Brake Temperature Monitoring System (BTMS) is installed:

No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 48 minutes after landing, or until all the BTMS readings on the systems Display are below 3.0 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.

Performance Dispatch — Chapter PD

Text — Section 24

Introduction

This chapter contains self dispatch performance data intended primarily for use by flight crews in the event that information cannot be obtained from the airline dispatch office. The takeoff data provided is for a single takeoff flap at max takeoff thrust. The range of conditions covered is limited to those normally encountered in airline operation. In the event of conflict between the data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

Takeoff

The maximum allowable takeoff weight will be the least of the Field, Climb, Obstacle, Brake Energy and Tire Speed Limit Weights as determined from the tables shown.

Brake Energy or Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Field Limit Weight - Slope and Wind Corrections

These tables for dry and wet runways provide corrections to the field length available for the effects of runway slope and wind component along the runway. Enter the appropriate table with the available field length and runway slope to determine the slope corrected field length. Next enter the appropriate table with slope corrected field length and wind component to determine the slope and wind corrected field length.

Field and Climb Limit Weight

Tables are presented for selected airport pressure altitudes and runway conditions and show both Field and Climb Limit Weights. Enter the appropriate table for pressure altitude and runway condition with “Slope and Wind Corrected Field Length” determined above and airport OAT to obtain Field Limit Weight. Also read Climb Limit Weight for the same OAT. Intermediate altitudes may be interpolated or use next higher altitude. When finding a maximum weight for a wet runway, the dry runway limit weight must also be determined and the lower of the two weights used.

Obstacle Limit Weight

The Reference Obstacle Limit Weight table provides obstacle limit weights for reference airport conditions based on obstacle height above the runway surface and distance from brake release. Enter the adjustment tables to adjust the reference Obstacle Limit Weight for the effects of OAT, pressure altitude and wind as indicated. In the case of multiple obstacles, enter the tables successively with each obstacle and determine the most limiting weight.

Tire Speed Limit

Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Maximum tire speed limited weights are presented for 225 MPH tires. To determine the tire speed limit weight, enter the table with OAT and airport pressure altitude. Adjust the tire speed limit weight according to the notes below the table to account for wind.

Brake Energy Limit VMBE

Brake Energy Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

The Maximum Brake Energy Speed table provides the Reference VMBE for a variety of airport pressure altitudes and temperatures. Enter the Weight Adjusted VMBE table to adjust the Reference VMBE for the actual brake release gross weight. Correct VMBE for slope and wind. If V1 exceeds VMBE, decrease brake release weight as indicated for each knot that V1 exceeds VMBE and determine V1, VR, and V2 for the lower brake release weight.

Enroute

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. Note that this table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Trip Fuel and Time

Long Range Cruise Trip Fuel and Time tables are provided to determine trip time and fuel required to destination.

To determine trip fuel and time for a constant altitude cruise, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the planned landing weight to obtain the adjustment to the fuel required at the planned landing weight.

Long Range Cruise Step Climb Trip Fuel and Time

The Long Range Cruise Step Climb Trip Fuel and Time tables are provided to determine trip time and fuel required to destination when flying a step climb profile. Step climb profiles are based on 4000 ft step climbs to keep the flight within 2000 ft of the optimum altitude for the current cruise weight. To determine trip fuel and time, enter the Ground to Air Miles Conversion table and determine air distance as discussed above. Then enter the Trip Fuel and Time Required table with air distance and planned landing weight to read trip fuel. Continue across the table to read trip time.

Short Trip Fuel and Time

These tables are provided to determine trip fuel and time for short distances or alternates. Obtain air distance from the table using the ground distance and wind component to the alternate. Enter the Trip Fuel and Time Required table with air distance and read trip fuel required for the expected landing weight, together with time to alternate at right. For distances greater than shown or other altitudes, use the Long Range Cruise Trip Fuel and Time tables.

Holding Planning

This table provides total fuel flow information necessary for planning flaps up holding and reserve fuel requirements. Data is based on the FMC holding speed schedule which is the higher of the maximum endurance and flaps up maneuver speeds. As noted, the fuel flow is based on flight in a racetrack holding pattern. For holding in straight and level flight, reduce table values by 5%.

Flight Crew Oxygen Requirements

This airplane is equipped with a chemical passenger oxygen system. Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. The oxygen quantity associated with the above requirements is achieved with the minimum dispatch oxygen cylinder pressure.

To determine the minimum dispatch oxygen cylinder pressure enter the appropriate flight crew oxygen table with the number of crew plus observers using oxygen and read the minimum cylinder pressure required for the appropriate cylinder temperature.

Net Level Off Weight

The Net Level Off Weight table is provided to determine terrain clearance capability in straight and level flight following an engine failure. Regulations require terrain clearance planning based on net performance which is the gross (or actual) gradient performance degraded by 1.1%. In addition, the net level off pressure altitude must clear the terrain by 1000 ft.

To determine the maximum weight for terrain clearance, enter the table with required net level off pressure altitude and expected ISA deviation to obtain weight. Adjust weight for anti-ice operation as noted below the table.

Landing

Tables are provided for determining the maximum landing weight as limited by field length or climb requirements for a single landing flap.

Maximum landing weight is the lowest of the field length limit weight, climb limit weight, or maximum certified landing weight.

Landing Field Limit Weight

For the expected runway condition and anti-skid system configuration, obtain wind corrected field length by entering the Wind Corrected Field Length table with field length available and wind component along the runway. Now enter the Field Limit Weight table with wind corrected field length and pressure altitude to read field limit weight.

Landing Climb Limit Weight

Enter the table with airport OAT and pressure altitude to read landing climb limit weight. Apply the noted adjustments as required.

Go-Around Climb Gradient

Enter the Reference Go-Around Gradient table with airport OAT and pressure altitude to determine the reference go-around gradient. Then adjust the reference gradient for airplane weight and speed using the tables provided to determine the weight and speed adjusted go-around gradient. Apply the necessary corrections for engine bleed configuration and icing conditions as noted.

Quick Turnaround Limit Weight

Enter the appropriate table (Steel or Carbon Brakes) with airport pressure altitude and OAT to read maximum quick turnaround weight. Apply the noted adjustments as required.

If the landing weight exceeds the maximum quick turnaround weight, wait the specified time and then check that the wheel thermal plugs have not melted before executing a subsequent takeoff. For Steel Brakes, the alternate procedures on the charts can be used to ensure the brake temperature is within limits. These procedures cannot be used for carbon brakes.

Gear Down

This section provides flight planning data for revenue operation with gear down. Unless otherwise noted, the gear down tables in this section are identical in format and usage to the corresponding gear up tables previously described.

To eliminate erroneous displays the flight crew should enter only gross weight data on the PERF INIT page of the Control Display Unit (CDU). Omission of the cost index and cruise altitude entries on the PERF INIT page will render the VNAV function unavailable during flight. As a result, the following information will not be provided: VNAV guidance and speed schedules, trip fuel and ETA predictions, optimum and maximum altitude data, step climb and top of descent predictions, and the VNAV descent guidance path.

The gross weight entry allows the FMCS takeoff and approach speed schedules to be generated. In addition, the flap maneuver speed and VREF speed bugs will be available for display on the primary flight display speed tape. Except for VNAV, normal autopilot and autothrottle modes will remain available for use during the flight, as will the LNAV mode.

Takeoff/Landing Climb Limit Weight

Enter the appropriate table with airport OAT and pressure altitude to determine Takeoff/Landing Climb Limit Weight with gear down. Correct the weight obtained for engine bleed configuration as required.

Performance Dispatch — Chapter PD
Table of Contents — Section 30

737-700W CFM56-7B26 KG JAA CATF/M

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

15	56.7	54.6	53.3	52.0	50.7	49.3	47.9	46.6	45.2
10 & BELOW	56.7	54.6	53.3	52.0	50.7	49.3	47.9	46.7	45.4

Takeoff at the -7B26 thrust rating requires observance of a minimum takeoff weight in order to maintain airplane controllability during takeoff. For takeoff at weights below the minimum takeoff weight, use of a lower thrust rating (certified derate) is required. Note that the assumed temperature method of reducing thrust may not be used as a means to comply with this restriction.

With engine bleed for packs off, increase field limit weight by 400 kg and climb limit weight by 1350 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 700 kg and climb limit weight by 1550 kg.

With engine bleed for packs off, increase field limit weight by 400 kg and climb limit weight by 1350 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 750 kg and climb limit weight by 1550 kg.

With engine bleed for packs off, increase field limit weight by 400 kg and climb limit weight by 1350 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 750 kg and climb limit weight by 1550 kg.

Takeoff Obstacle Limit Weight

Flaps 5

Sea Level, 30°C & Below, Zero Wind

Based on engine bleed for packs on and anti-ice off

When using line-up allowances, the obstacle distance from brake release must be reduced by the ASDA adjustment.
Obstacle height must be calculated from lowest point of the runway to conservatively account for runway slope.

With engine bleed for packs off, increase field limit weight by 400 kg and climb limit weight by 1500 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 700 kg and climb limit weight by 1450 kg.

When using line-up allowances, the obstacle distance from brake release must be reduced by the ASDA adjustment.
Obstacle height must be calculated from lowest point of the runway to conservatively account for runway slope.

With engine bleed for packs off, increase weight by 650 kg.
With engine anti-ice on, decrease weight by 300 kg.
With engine and wing anti-ice on, decrease weight by 1550 kg (optional system).

Based on 280/.78 climb, Long Range Cruise speed and .78/280/250 descent.
Valid for all pressure altitudes with 4000 ft step climb to 2000 ft above optimum altitude.

**Increase weight by 800 kg per 1% uphill slope. Decrease weight by 1050 kg per 1% downhill slope.
Increase weight by 1850 kg per 10 knots headwind. Decrease weight by 6850 kg per 10 knots tailwind.
After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 67 minutes and check that wheel thermal plugs have not melted before executing a subsequent takeoff.**

**As an alternate procedure, ensure that each brake pressure plate temperature, without artificial cooling, is less than 425°F as follows:
No sooner than 10 and no later than 15 minutes after parking, measure each brake pressure plate surface temperature at a minimum of two points per brake by an accurate method (using a Doric Microtemp 450 hand held thermometer or equivalent, hold temperature probe in place for 20 seconds or until reading stabilizes). If each measured temperature is less than 425°F, immediate dispatch is allowed; otherwise the required minimum ground wait period of 67 minutes applies.**

If a Brake Temperature Monitoring System (BTMS) is installed:

**No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 67 minutes after landing, or until all the BTMS readings on the Systems Display are below 3.5 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.**

Quick Turnaround Limit Weight - Category M Carbon Brakes

Performance Dispatch — Chapter PD
Text — Section 34

Introduction

This chapter contains self dispatch performance data intended primarily for use by flight crews in the event that information cannot be obtained from the airline dispatch office. The takeoff data provided is for a single takeoff flap. The range of conditions covered is limited to those normally encountered in airline operation. In the event of conflict between the data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

Takeoff

The maximum allowable takeoff weight will be the least of the Field, Climb, Obstacle, Brake Energy and Tire Speed Limit Weights as determined from the tables shown.

Brake Energy or Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

EUOPS-1 requires that the runway length be adjusted to account for alignment of the airplane prior to takeoff. The table below provides TORA, TODA and ASDA adjustments for both 90 degree taxiway entry and 180 degree turnaround. These values may be used when obtaining takeoff weights from the Airplane Flight Manual or a takeoff analysis program. When using line-up allowances with the Field Length Limit chart, the field length available must be reduced by the ASDA adjustment.

	90 DEGREE TAXIWAY ENTRY	180 DEGREE TURNAROUND	
		60 M (200 FT) RUNWAY	45 M (150 FT) RUNWAY
	LINE-UP DISTANCE - M (FT)	LINE-UP DISTANCE - M (FT)	LINE-UP DISTANCE - M (FT)
TORA & TODA	10 (32)	16 (54)	16 (54)
ASDA	22 (74)	29 (95)	29 (95)

Minimum Takeoff Weight

Takeoff at the -7B26 thrust rating requires observance of a minimum takeoff weight in order to maintain airplane controllability during takeoff. For takeoff at weights below the minimum takeoff weight, use of a lower thrust rating (certified derate) is required. Note that the assumed temperature method of reducing thrust may not be used as a means to comply with this restriction. The conservative minimum takeoff weight is 56699 kg at the -7B26 takeoff thrust. Alternatively, lower minimum takeoff weights may be obtained, for the actual pressure altitude and outside air temperature, by using the Minimum Takeoff Weight table provided.

Field Limit Weight - Slope and Wind Corrections

These tables for dry and wet runways provide corrections to the field length available for the effects of runway slope and wind component along the runway. Enter the appropriate table with the available field length and runway slope to determine the slope corrected field length. Next enter the appropriate table with slope corrected field length and wind component to determine the slope and wind corrected field length.

Field and Climb Limit Weight

Tables are presented for selected airport pressure altitudes and runway conditions and show both Field and Climb Limit Weights. Enter the appropriate table for pressure altitude and runway condition with “Slope and Wind Corrected Field Length” determined above and airport OAT to obtain Field Limit Weight. Also read Climb Limit Weight for the same OAT. Intermediate altitudes may be interpolated or use next higher altitude. When finding a maximum weight for a wet runway, the dry runway limit weight must also be determined and the lower of the two weights used.

Obstacle Limit Weight

The Reference Obstacle Limit Weight table provides obstacle limit weights for reference airport conditions based on obstacle height above the runway surface and distance from brake release. Enter the adjustment tables to adjust the reference Obstacle Limit Weight for the effects of OAT, pressure altitude and wind as indicated. In the case of multiple obstacles, enter the tables successively with each obstacle and determine the most limiting weight.

When using line-up allowances with the Obstacle Limit chart, the obstacle distance from brake release must be reduced by the ASDA adjustment.

Tire Speed Limit

Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Maximum tire speed limited weights are presented for 225 MPH tires. To determine the tire speed limit weight, enter the table with OAT and airport pressure altitude. Adjust the tire speed limit weight according to the notes below the table to account for wind.

Brake Energy Limit VMBE

Brake Energy Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

The Maximum Brake Energy Speed table provides the Reference VMBE for a variety of airport pressure altitudes and temperatures. Enter the Weight Adjusted VMBE table to adjust the Reference VMBE for the actual brake release gross weight. Correct VMBE for slope and wind. If V1 exceeds VMBE, decrease brake release weight as indicated for each knot that V1 exceeds VMBE and determine V1, VR, and V2 for the lower brake release weight.

Enroute

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. Note that this table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Trip Fuel and Time

Long Range Cruise Trip Fuel and Time tables are provided to determine trip time and fuel required to destination.

To determine trip fuel and time for a constant altitude cruise, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the planned landing weight to obtain the adjustment to the fuel required at the planned landing weight.

Long Range Cruise Step Climb Trip Fuel and Time

The Long Range Cruise Step Climb Trip Fuel and Time tables are provided to determine trip time and fuel required to destination when flying a step climb profile. Step climb profiles are based on 4000 ft step climbs to keep the flight within 2000 ft of the optimum altitude for the current cruise weight. To determine trip fuel and time, enter the Ground to Air Miles Conversion table and determine air distance as discussed above. Then enter the Trip Fuel and Time Required table with air distance and planned landing weight to read trip fuel. Continue across the table to read trip time.

Short Trip Fuel and Time

These tables are provided to determine trip fuel and time for short distances or alternates. Obtain air distance from the table using the ground distance and wind component to the alternate. Enter the Trip Fuel and Time Required table with air distance and read trip fuel required for the expected landing weight, together with time to alternate at right. For distances greater than shown or other altitudes, use the Long Range Cruise Trip Fuel and Time tables.

Holding Planning

This table provides total fuel flow information necessary for planning flaps up holding and reserve fuel requirements. Data is based on the FMC holding speed schedule which is the higher of the maximum endurance and flaps up maneuver speeds. As noted, the fuel flow is based on flight in a racetrack holding pattern. For holding in straight and level flight, reduce table values by 5%.

Flight Crew Oxygen Requirements

This airplane is equipped with a chemical passenger oxygen system. Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. The oxygen quantity associated with the above requirements is achieved with the minimum dispatch oxygen cylinder pressure.

To determine the minimum dispatch oxygen cylinder pressure enter the appropriate flight crew oxygen table with the number of crew plus observers using oxygen and read the minimum cylinder pressure required for the appropriate cylinder temperature.

Net Level Off Weight

The Net Level Off Weight table is provided to determine terrain clearance capability in straight and level flight following an engine failure. Regulations require terrain clearance planning based on net performance which is the gross (or actual) gradient performance degraded by 1.1%. In addition, the net level off pressure altitude must clear the terrain by 1000 ft.

To determine the maximum weight for terrain clearance, enter the table with required net level off pressure altitude and expected ISA deviation to obtain weight. Adjust weight for anti-ice operation as noted below the table.

Landing

Tables are provided for determining the maximum landing weight as limited by field length or climb requirements for a single landing flap.

Maximum landing weight is the lowest of the field length limit weight, climb limit weight, or maximum certified landing weight.

Landing Field Limit Weight

For the expected runway condition and anti-skid system configuration, obtain wind corrected field length by entering the Wind Corrected Field Length table with field length available and wind component along the runway. Now enter the Field Limit Weight table with wind corrected field length and pressure altitude to read field limit weight.

Landing Climb Limit Weight

Enter the table with airport OAT and pressure altitude to read landing climb limit weight. Apply the noted adjustments as required.

Go-Around Climb Gradient

Enter the Reference Go-Around Gradient table with airport OAT and pressure altitude to determine the reference go-around gradient. Then adjust the reference gradient for airplane weight and speed using the tables provided to determine the weight and speed adjusted go-around gradient. Apply the necessary corrections for engine bleed configuration and icing conditions as noted.

Quick Turnaround Limit Weight

Enter the appropriate table (Steel or Carbon Brakes) with airport pressure altitude and OAT to read maximum quick turnaround weight. Apply the noted adjustments as required.

If the landing weight exceeds the maximum quick turnaround weight, wait the specified time and then check that the wheel thermal plugs have not melted before executing a subsequent takeoff. For Steel Brakes, the alternate procedures on the charts can be used to ensure the brake temperature is within limits. These procedures cannot be used for carbon brakes.

Gear Down

This section provides flight planning data for revenue operation with gear down. Unless otherwise noted, the gear down tables in this section are identical in format and usage to the corresponding gear up tables previously described.

To eliminate erroneous displays the flight crew should enter only gross weight data on the PERF INIT page of the Control Display Unit (CDU). Omission of the cost index and cruise altitude entries on the PERF INIT page will render the VNAV function unavailable during flight. As a result, the following information will not be provided: VNAV guidance and speed schedules, trip fuel and ETA predictions, optimum and maximum altitude data, step climb and top of descent predictions, and the VNAV descent guidance path.

The gross weight entry allows the FMCS takeoff and approach speed schedules to be generated. In addition, the flap maneuver speed and VREF speed bugs will be available for display on the primary flight display speed tape. Except for VNAV, normal autopilot and autothrottle modes will remain available for use during the flight, as will the LNAV mode.

Takeoff/Landing Climb Limit Weight

Enter the appropriate table with airport OAT and pressure altitude to determine Takeoff/Landing Climb Limit Weight with gear down. Correct the weight obtained for engine bleed configuration as required.

737-800 CFM56-7B26 C KG M FAA CATC/N

Performance Dispatch — Chapter PD
Pkg Model Identification — Section 40

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

With engine bleed for packs off, increase field limit weight by 350 kg and climb limit weight by 1250 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 950 kg and climb limit weight by 1400 kg.

Flight Crew and Supernumerary Requirements for Freighter Oxygen System

Table 1
Crew and Supernumerary Oxygen

NUMBER OF CREW AND SUPERNUMERARIES	LITERS OF UNDILUTED (100%) OXYGEN TIME (MINUTES)				
	30	60	90	120	180
2	1210	1740	2100	2450	3150
3	1560	2350	2880	3410	4470
4	1900	2960	3660	4370	5780
5	2240	3560	4440	5330	7090
6	2580	4170	5230	6280	8400
7	2920	4770	6010	7240	9710
8	3260	5380	6790	8200	11030

For more extensive than normal crew usage, add 2.05 liters/person/minute for each crew member at 8000 ft cabin altitude when regulator setting is NORMAL; or 13 liters/person/minute when regulator setting is 100%.

Table 2
Volume to Pressure Conversion for Two 115 Cubic Ft. Cylinders

OXYGEN VOLUME (1000 LITERS)	CYLINDER PRESSURE AT 21°C (PSI)
0.3	200
0.7	300
1.0	400
1.4	500
1.7	600
2.1	700
2.4	800
2.8	900
3.1	1000
3.5	1100
3.8	1200
4.2	1300
4.5	1400
4.9	1500
5.2	1600
5.5	1700
5.9	1800
6.2	1900
6.6	2000

Check maximum pressure in shaded area. Maximum cylinder pressure = 1850 PSI at 21°C. For maximum cylinder pressure at hotter or colder temperatures, add or subtract 32 PSI per 5°C, respectively.

Table 3
Temperature Corrections

CYLINDER PRESSURE AT 21°C (PSI)	PRESSURE CORRECTION FOR EACH 5°C ABOVE/BELOW 21°C (PSI)

**Increase weight by 700 kg per 1% uphill slope. Decrease weight by 1200 kg per 1% downhill slope.
Increase weight by 1850 kg per 10 knots headwind. Decrease weight by 7750 kg per 10 knots tailwind.
After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 67 minutes and check that wheel thermal plugs have not melted before executing a subsequent takeoff.**

As an alternate procedure, ensure that each brake pressure plate surface temperature, without artificial cooling, is less than 218°C as follows: No sooner than 10 and no later than 15 minutes after parking, measure each brake pressure plate surface temperature at a minimum of two points per brake by an accurate method (using a Doric Microtemp 450 hand held thermometer or equivalent, hold temperature probe in place for 20 seconds or until reading stabilizes). If each measured temperature is less than 218°C, immediate dispatch is allowed; otherwise the required minimum ground wait period of 67 minutes applies.

If a Brake Temperature Monitoring System (BTMS) is installed:

**No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 67 minutes after landing, or until all the BTMS readings on the systems Display are below 3.5 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.**

Introduction

This chapter contains self dispatch performance data intended primarily for use by flight crews in the event that information cannot be obtained from the airline dispatch office. The takeoff data provided is for a single takeoff flap at max takeoff thrust. The range of conditions covered is limited to those normally encountered in airline operation. In the event of conflict between the data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

Takeoff

The maximum allowable takeoff weight will be the least of the Field, Climb, Obstacle, Brake Energy and Tire Speed Limit Weights as determined from the tables shown.

Brake Energy or Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Field Limit Weight - Slope and Wind Corrections

These tables for dry and wet runways provide corrections to the field length available for the effects of runway slope and wind component along the runway. Enter the appropriate table with the available field length and runway slope to determine the slope corrected field length. Next enter the appropriate table with slope corrected field length and wind component to determine the slope and wind corrected field length.

Field and Climb Limit Weight

Tables are presented for selected airport pressure altitudes and runway conditions and show both Field and Climb Limit Weights. Enter the appropriate table for pressure altitude and runway condition with “Slope and Wind Corrected Field Length” determined above and airport OAT to obtain Field Limit Weight. Also read Climb Limit Weight for the same OAT. Intermediate altitudes may be interpolated or use next higher altitude. When finding a maximum weight for a wet runway, the dry runway limit weight must also be determined and the lower of the two weights used.

Obstacle Limit Weight

The Reference Obstacle Limit Weight table provides obstacle limit weights for reference airport conditions based on obstacle height above the runway surface and distance from brake release. Enter the adjustment tables to adjust the reference Obstacle Limit Weight for the effects of OAT, pressure altitude and wind as indicated. In the case of multiple obstacles, enter the tables successively with each obstacle and determine the most limiting weight.

Tire Speed Limit

Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Maximum tire speed limited weights are presented for 225 MPH tires. To determine the tire speed limit weight, enter the table with OAT and airport pressure altitude. Adjust the tire speed limit weight according to the notes below the table to account for wind.

Brake Energy Limit VMBE

Brake Energy Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

The Maximum Brake Energy Speed table provides the Reference VMBE for a variety of airport pressure altitudes and temperatures. Enter the Weight Adjusted VMBE table to adjust the Reference VMBE for the actual brake release gross weight. Correct VMBE for slope and wind. If V1 exceeds VMBE, decrease brake release weight as indicated for each knot that V1 exceeds VMBE and determine V1, VR, and V2 for the lower brake release weight.

Enroute

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. Note that this table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Trip Fuel and Time

Long Range Cruise Trip Fuel and Time tables are provided to determine trip time and fuel required to destination.

To determine trip fuel and time for a constant altitude cruise, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the planned landing weight to obtain the adjustment to the fuel required at the planned landing weight.

Long Range Cruise Step Climb Trip Fuel and Time

The Long Range Cruise Step Climb Trip Fuel and Time tables are provided to determine trip time and fuel required to destination when flying a step climb profile. Step climb profiles are based on 4000 ft step climbs to keep the flight within 2000 ft of the optimum altitude for the current cruise weight. To determine trip fuel and time, enter the Ground to Air Miles Conversion table and determine air distance as discussed above. Then enter the Trip Fuel and Time Required table with air distance and planned landing weight to read trip fuel. Continue across the table to read trip time.

Short Trip Fuel and Time

These tables are provided to determine trip fuel and time for short distances or alternates. Obtain air distance from the table using the ground distance and wind component to the alternate. Enter the Trip Fuel and Time Required table with air distance and read trip fuel required for the expected landing weight, together with time to alternate at right. For distances greater than shown or other altitudes, use the Long Range Cruise Trip Fuel and Time tables.

Holding Planning

This table provides total fuel flow information necessary for planning flaps up holding and reserve fuel requirements. Data is based on the FMC holding speed schedule which is the higher of the maximum endurance and flaps up maneuver speeds. As noted, the fuel flow is based on flight in a racetrack holding pattern. For holding in straight and level flight, reduce table values by 5%.

Flight Crew Requirements for Chemical Passenger Oxygen System

The flight crew oxygen system is a gaseous system. Flight crew oxygen tables are provided for both the chemical passenger oxygen system and the freighter oxygen system. Use the tables corresponding to the appropriate oxygen system installed.

Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. The oxygen quantity associated with the above requirements is achieved for the flight crew with the minimum dispatch oxygen cylinder pressure.

Tables are provided to determine the flight crew oxygen dispatch requirements for a chemical passenger oxygen system. To determine the minimum dispatch oxygen cylinder pressure enter the appropriate flight crew oxygen table with the number of crew plus observers using oxygen and read the minimum cylinder pressure required for the appropriate cylinder temperature.

Flight Crew and Supernumerary Requirements for Freighter Oxygen System

The flight crew oxygen system is a gaseous system.

Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. Sufficient oxygen must be provided to the supernumeraries for supplemental breathing in the event of a cabin depressurization or a main deck cargo fire.

Data are provided to determine the total oxygen dispatch requirement. Table 1 shows the quantity of oxygen required to complete an emergency descent to 25000 ft, level off for the diversion time, and continue descent below 10000 ft with the regulator set to "100%" for the flight crew protective breathing requirement. Table 1 includes values for up to eight people to account for up to four crew members and up to four supernumeraries.

Both the crew oxygen and supernumerary oxygen draw from the same set of oxygen cylinders. To determine the total oxygen required for dispatch, enter the table for the total number of crew plus supernumeraries and read required liters of 100% oxygen for the maximum diversion time.

Additional adjustments for more extensive than normal crew usage can be made by adding 2.05 liters/person/minute (0.6 psi/person/minute for the dual cylinder system) or 13 liters/person/minute (4 psi/person/minute) if 100% oxygen is selected during normal usage.

After determining the total volume (liters) required for the flight crew plus supernumeraries, obtain the dispatch pressure required from the Cylinder Volume to Pressure Conversion table (Table 2). Adjust this reading for cylinder temperature as required, using the adjustments given (Table 3).

Net Level Off Weight

The Net Level Off Weight table is provided to determine terrain clearance capability in straight and level flight following an engine failure. Regulations require terrain clearance planning based on net performance which is the gross (or actual) gradient performance degraded by 1.1%. In addition, the net level off pressure altitude must clear the terrain by 1000 ft.

To determine the maximum weight for terrain clearance, enter the table with required net level off pressure altitude and expected ISA deviation to obtain weight. Adjust weight for anti-ice operation as noted below the table.

Landing

Tables are provided for determining the maximum landing weight as limited by field length or climb requirements for a single landing flap.

Maximum landing weight is the lowest of the field length limit weight, climb limit weight, or maximum certified landing weight.

Landing Field Limit Weight

For the expected runway condition and anti-skid system configuration, obtain wind corrected field length by entering the Wind Corrected Field Length table with field length available and wind component along the runway. Now enter the Field Limit Weight table with wind corrected field length and pressure altitude to read field limit weight.

Landing Climb Limit Weight

Enter the table with airport OAT and pressure altitude to read landing climb limit weight. Apply the noted adjustments as required.

Go-Around Climb Gradient

Enter the Reference Go-Around Gradient table with airport OAT and pressure altitude to determine the reference go-around gradient. Then adjust the reference gradient for airplane weight and speed using the tables provided to determine the weight and speed adjusted go-around gradient. Apply the necessary corrections for engine bleed configuration and icing conditions as noted.

Quick Turnaround Limit Weight

Enter the appropriate table (Steel or Carbon Brakes) with airport pressure altitude and OAT to read maximum quick turnaround weight. Apply the noted adjustments as required.

If the landing weight exceeds the maximum quick turnaround weight, wait the specified time and then check that the wheel thermal plugs have not melted before executing a subsequent takeoff. For Steel Brakes, the alternate procedures on the charts can be used to ensure the brake temperature is within limits. These procedures cannot be used for carbon brakes.

Gear Down

This section provides flight planning data for revenue operation with gear down. Unless otherwise noted, the gear down tables in this section are identical in format and usage to the corresponding gear up tables previously described.

To eliminate erroneous displays the flight crew should enter only gross weight data on the PERF INIT page of the Control Display Unit (CDU). Omission of the cost index and cruise altitude entries on the PERF INIT page will render the VNAV function unavailable during flight. As a result, the following information will not be provided: VNAV guidance and speed schedules, trip fuel and ETA predictions, optimum and maximum altitude data, step climb and top of descent predictions, and the VNAV descent guidance path.

The gross weight entry allows the FMCS takeoff and approach speed schedules to be generated. In addition, the flap maneuver speed and VREF speed bugs will be available for display on the primary flight display speed tape. Except for VNAV, normal autopilot and autothrottle modes will remain available for use during the flight, as will the LNAV mode.

Takeoff/Landing Climb Limit Weight

Enter the appropriate table with airport OAT and pressure altitude to determine Takeoff/Landing Climb Limit Weight with gear down. Correct the weight obtained for engine bleed configuration as required.

Performance Dispatch — Chapter PD
Table of Contents — Section 50

737-800W CFM56-7B26 C M KG FAA CATC/N

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

With engine bleed for packs off, increase field limit weight by 350 kg and climb limit weight by 1350 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 950 kg and climb limit weight by 1500 kg.

With engine bleed for packs off, increase field limit weight by 350 kg and climb limit weight by 1350 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 800 kg and climb limit weight by 1500 kg.

Increase VMBE by 1 knot per 1% uphill runway slope. Decrease VMBE by 4 knots per 1% downhill runway slope.
Increase VMBE by 3 knots per 10 knots headwind. Decrease VMBE by 19 knots per 10 knots tailwind.
Decrease brake release weight by 500 kg for each knot V1 exceeds VMBE.
Determine normal V1, VR, V2 speeds for lower brake release weight.

-10	14	430	600	770

Flight Crew and Supernumerary Requirements for Freighter Oxygen System

Table 1
Crew and Supernumerary Oxygen

NUMBER OF CREW AND SUPERNUMERARIES	LITERS OF UNDILUTED (100%) OXYGEN TIME (MINUTES)				
	30	60	90	120	180
2	1210	1740	2100	2450	3150
3	1560	2350	2880	3410	4470
4	1900	2960	3660	4370	5780
5	2240	3560	4440	5330	7090
6	2580	4170	5230	6280	8400
7	2920	4770	6010	7240	9710
8	3260	5380	6790	8200	11030

For more extensive than normal crew usage, add 2.05 liters/person/minute for each crew member at 8000 ft cabin altitude when regulator setting is NORMAL; or 13 liters/person/minute when regulator setting is 100%.

Table 2
Volume to Pressure Conversion for Two 115 Cubic Ft. Cylinders

OXYGEN VOLUME (1000 LITERS)	CYLINDER PRESSURE AT 21°C (PSI)
0.3	200
0.7	300
1.0	400
1.4	500
1.7	600
2.1	700
2.4	800
2.8	900
3.1	1000
3.5	1100
3.8	1200
4.2	1300
4.5	1400
4.9	1500
5.2	1600
5.5	1700
5.9	1800
6.2	1900
6.6	2000

Check maximum pressure in shaded area. Maximum cylinder pressure = 1850 PSI at 21°C. For maximum cylinder pressure at hotter or colder temperatures, add or subtract 32 PSI per 5°C, respectively.

Table 3
Temperature Corrections

CYLINDER PRESSURE AT 21°C (PSI)	PRESSURE CORRECTION FOR EACH 5°C ABOVE/BELOW 21°C (PSI)
400	+7/-7
600	+11/-11
800	+14/-14
1000	+17/-17
1200	+21/-21
1400	+24/-24
1600	+28/-28
1800	+31/-31
2000	+34/-34

With engine bleeds for packs off, increase weight by 1250 kg.
With engine anti-ice on, decrease weight by 250 kg.
With engine and wing anti-ice on, decrease weight by 1400 kg.
When operating in icing conditions during any part of the flight with forecast landing temperature below 10°C, decrease weight by 7350 kg.

-54	86.1	86.1	86.1	86.1	84.1	80.7

Increase weight by 700 kg per 1% uphill slope. Decrease weight by 1200 kg per 1% downhill slope. Increase weight by 1850 kg per 10 knots headwind. Decrease weight by 7750 kg per 10 knots tailwind. After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 67 minutes and check that wheel thermal plugs have not melted before executing a subsequent takeoff.

As an alternate procedure, ensure that each brake pressure plate surface temperature, without artificial cooling, is less than 218°C as follows: No sooner than 10 and no later than 15 minutes after parking, measure each brake pressure plate surface temperature at a minimum of two points per brake by an accurate method (using a Doric Microtemp 450 hand held thermometer or equivalent, hold temperature probe in place for 20 seconds or until reading stabilizes). If each measured temperature is less than 218°C, immediate dispatch is allowed; otherwise the required minimum ground wait period of 67 minutes applies.

If a Brake Temperature Monitoring System (BTMS) is installed:

No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 67 minutes after landing, or until all the BTMS readings on the systems Display are below 3.5 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.

Quick Turnaround Limit Weight - Category N Carbon Brakes

-54	-65	86.1	86.1	84.1	80.9	77.7	74.5

Increase weight by 650 kg per 1% uphill slope. Decrease weight by 1200 kg per 1% downhill slope. Increase weight by 1550 kg per 10 knots headwind. Decrease weight by 8350 kg per 10 knots tailwind. After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 48 minutes and check that wheel thermal plugs have not melted before executing a takeoff.

If a Brake Temperature Monitoring System (BTMS) is installed:

No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 48 minutes after landing, or until all the BTMS readings on the systems Display are below 3.0 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.

Performance Dispatch — Chapter PD
Text — Section 54

Introduction

This chapter contains self dispatch performance data intended primarily for use by flight crews in the event that information cannot be obtained from the airline dispatch office. The takeoff data provided is for a single takeoff flap at max takeoff thrust. The range of conditions covered is limited to those normally encountered in airline operation. In the event of conflict between the data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

Takeoff

The maximum allowable takeoff weight will be the least of the Field, Climb, Obstacle, Brake Energy and Tire Speed Limit Weights as determined from the tables shown.

Brake Energy or Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Field Limit Weight - Slope and Wind Corrections

These tables for dry and wet runways provide corrections to the field length available for the effects of runway slope and wind component along the runway. Enter the appropriate table with the available field length and runway slope to determine the slope corrected field length. Next enter the appropriate table with slope corrected field length and wind component to determine the slope and wind corrected field length.

Field and Climb Limit Weight

Tables are presented for selected airport pressure altitudes and runway conditions and show both Field and Climb Limit Weights. Enter the appropriate table for pressure altitude and runway condition with “Slope and Wind Corrected Field Length” determined above and airport OAT to obtain Field Limit Weight. Also read Climb Limit Weight for the same OAT. Intermediate altitudes may be interpolated or use next higher altitude. When finding a maximum weight for a wet runway, the dry runway limit weight must also be determined and the lower of the two weights used.

Obstacle Limit Weight

The Reference Obstacle Limit Weight table provides obstacle limit weights for reference airport conditions based on obstacle height above the runway surface and distance from brake release. Enter the adjustment tables to adjust the reference Obstacle Limit Weight for the effects of OAT, pressure altitude and wind as indicated. In the case of multiple obstacles, enter the tables successively with each obstacle and determine the most limiting weight.

Tire Speed Limit

Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Maximum tire speed limited weights are presented for 225 MPH tires. To determine the tire speed limit weight, enter the table with OAT and airport pressure altitude. Adjust the tire speed limit weight according to the notes below the table to account for wind.

Brake Energy Limit VMBE

Brake Energy Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

The Maximum Brake Energy Speed table provides the Reference VMBE for a variety of airport pressure altitudes and temperatures. Enter the Weight Adjusted VMBE table to adjust the Reference VMBE for the actual brake release gross weight. Correct VMBE for slope and wind. If V1 exceeds VMBE, decrease brake release weight as indicated for each knot that V1 exceeds VMBE and determine V1, VR, and V2 for the lower brake release weight.

Enroute

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. Note that this table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Trip Fuel and Time

Long Range Cruise Trip Fuel and Time tables are provided to determine trip time and fuel required to destination.

To determine trip fuel and time for a constant altitude cruise, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the planned landing weight to obtain the adjustment to the fuel required at the planned landing weight.

Long Range Cruise Step Climb Trip Fuel and Time

The Long Range Cruise Step Climb Trip Fuel and Time tables are provided to determine trip time and fuel required to destination when flying a step climb profile. Step climb profiles are based on 4000 ft step climbs to keep the flight within 2000 ft of the optimum altitude for the current cruise weight. To determine trip fuel and time, enter the Ground to Air Miles Conversion table and determine air distance as discussed above. Then enter the Trip Fuel and Time Required table with air distance and planned landing weight to read trip fuel. Continue across the table to read trip time.

Short Trip Fuel and Time

These tables are provided to determine trip fuel and time for short distances or alternates. Obtain air distance from the table using the ground distance and wind component to the alternate. Enter the Trip Fuel and Time Required table with air distance and read trip fuel required for the expected landing weight, together with time to alternate at right. For distances greater than shown or other altitudes, use the Long Range Cruise Trip Fuel and Time tables.

Holding Planning

This table provides total fuel flow information necessary for planning flaps up holding and reserve fuel requirements. Data is based on the FMC holding speed schedule which is the higher of the maximum endurance and flaps up maneuver speeds. As noted, the fuel flow is based on flight in a racetrack holding pattern. For holding in straight and level flight, reduce table values by 5%.

Flight Crew Requirements for Chemical Passenger Oxygen System

The flight crew oxygen system is a gaseous system. Flight crew oxygen tables are provided for both the chemical passenger oxygen system and the freighter oxygen system. Use the tables corresponding to the appropriate oxygen system installed.

Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. The oxygen quantity associated with the above requirements is achieved for the flight crew with the minimum dispatch oxygen cylinder pressure.

Tables are provided to determine the flight crew oxygen dispatch requirements for a chemical passenger oxygen system. To determine the minimum dispatch oxygen cylinder pressure enter the appropriate flight crew oxygen table with the number of crew plus observers using oxygen and read the minimum cylinder pressure required for the appropriate cylinder temperature.

Flight Crew and Supernumerary Requirements for Freighter Oxygen System

The flight crew oxygen system is a gaseous system.

Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. Sufficient oxygen must be provided to the supernumeraries for supplemental breathing in the event of a cabin depressurization or a main deck cargo fire.

Data are provided to determine the total oxygen dispatch requirement. Table 1 shows the quantity of oxygen required to complete an emergency descent to 25000 ft, level off for the diversion time, and continue descent below 10000 ft with the regulator set to "100%" for the flight crew protective breathing requirement. Table 1 includes values for up to eight people to account for up to four crew members and up to four supernumeraries.

Both the crew oxygen and supernumerary oxygen draw from the same set of oxygen cylinders. To determine the total oxygen required for dispatch, enter the table for the total number of crew plus supernumeraries and read required liters of 100% oxygen for the maximum diversion time.

Additional adjustments for more extensive than normal crew usage can be made by adding 2.05 liters/person/minute (0.6 psi/person/minute for the dual cylinder system) or 13 liters/person/minute (4 psi/person/minute) if 100% oxygen is selected during normal usage.

After determining the total volume (liters) required for the flight crew plus supernumeraries, obtain the dispatch pressure required from the Cylinder Volume to Pressure Conversion table (Table 2). Adjust this reading for cylinder temperature as required, using the adjustments given (Table 3).

Net Level Off Weight

The Net Level Off Weight table is provided to determine terrain clearance capability in straight and level flight following an engine failure. Regulations require terrain clearance planning based on net performance which is the gross (or actual) gradient performance degraded by 1.1%. In addition, the net level off pressure altitude must clear the terrain by 1000 ft.

To determine the maximum weight for terrain clearance, enter the table with required net level off pressure altitude and expected ISA deviation to obtain weight. Adjust weight for anti-ice operation as noted below the table.

Landing

Tables are provided for determining the maximum landing weight as limited by field length or climb requirements for a single landing flap.

Maximum landing weight is the lowest of the field length limit weight, climb limit weight, or maximum certified landing weight.

Landing Field Limit Weight

For the expected runway condition and anti-skid system configuration, obtain wind corrected field length by entering the Wind Corrected Field Length table with field length available and wind component along the runway. Now enter the Field Limit Weight table with wind corrected field length and pressure altitude to read field limit weight.

Landing Climb Limit Weight

Enter the table with airport OAT and pressure altitude to read landing climb limit weight. Apply the noted adjustments as required.

Go-Around Climb Gradient

Enter the Reference Go-Around Gradient table with airport OAT and pressure altitude to determine the reference go-around gradient. Then adjust the reference gradient for airplane weight and speed using the tables provided to determine the weight and speed adjusted go-around gradient. Apply the necessary corrections for engine bleed configuration and icing conditions as noted.

Quick Turnaround Limit Weight

Enter the appropriate table (Steel or Carbon Brakes) with airport pressure altitude and OAT to read maximum quick turnaround weight. Apply the noted adjustments as required.

If the landing weight exceeds the maximum quick turnaround weight, wait the specified time and then check that the wheel thermal plugs have not melted before executing a subsequent takeoff. For Steel Brakes, the alternate procedures on the charts can be used to ensure the brake temperature is within limits. These procedures cannot be used for carbon brakes.

Gear Down

This section provides flight planning data for revenue operation with gear down. Unless otherwise noted, the gear down tables in this section are identical in format and usage to the corresponding gear up tables previously described.

To eliminate erroneous displays the flight crew should enter only gross weight data on the PERF INIT page of the Control Display Unit (CDU). Omission of the cost index and cruise altitude entries on the PERF INIT page will render the VNAV function unavailable during flight. As a result, the following information will not be provided: VNAV guidance and speed schedules, trip fuel and ETA predictions, optimum and maximum altitude data, step climb and top of descent predictions, and the VNAV descent guidance path.

The gross weight entry allows the FMCS takeoff and approach speed schedules to be generated. In addition, the flap maneuver speed and VREF speed bugs will be available for display on the primary flight display speed tape. Except for VNAV, normal autopilot and autothrottle modes will remain available for use during the flight, as will the LNAV mode.

Takeoff/Landing Climb Limit Weight

Enter the appropriate table with airport OAT and pressure altitude to determine Takeoff/Landing Climb Limit Weight with gear down. Correct the weight obtained for engine bleed configuration as required.

Performance Dispatch — Chapter PD
Pkg Model Identification — Section 60

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

100	199	205	210	210	210	210	210	210	210	210	210

Increase VMBE by 1 knot per 1% uphill runway slope. Decrease VMBE by 4 knots per 1% downhill runway slope.
Increase VMBE by 2 knots per 10 knots headwind. Decrease VMBE by 19 knots per 10 knots tailwind.
Decrease brake release weight by 1100 lb for each knot V1 exceeds VMBE.
Determine normal V1, VR, V2 speeds for lower brake release weight.

With engine bleed for packs off, increase weight by 2300 lb.
With engine anti-ice on, decrease weight by 600 lb.
With engine and wing anti-ice on, decrease weight by 2000 lb.
When operating in icing conditions during any part of the flight with forecast landing temperature below 10°C, decrease weight by 12300 lb.

**Increase weight by 1500 lb per 1% uphill slope. Decrease weight by 3100 lb per 1% downhill slope.
Increase weight by 4000 lb per 10 knots headwind. Decrease weight by 16600 lb per 10 knots tailwind.
After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 67 minutes and check that wheel thermal plugs have not melted before executing a subsequent takeoff.**

**As an alternate procedure, ensure that each brake pressure plate temperature, without artificial cooling, is less than 218°C as follows:
No sooner than 10 and no later than 15 minutes after parking, measure each brake pressure plate surface temperature at a minimum of two points per brake by an accurate method (using a Doric Microtemp 450 hand held thermometer or equivalent, hold temperature probe in place for 20 seconds or until reading stabilizes). If each measured temperature is less than 218°C, immediate dispatch is allowed; otherwise the required minimum ground wait period of 67 minutes applies.**

If a Brake Temperature Monitoring System (BTMS) is installed:

**No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 67 minutes after landing, or until all the BTMS readings on the systems Display are below 3.5 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.**

Performance Dispatch — Chapter PD
Text — Section 64

Introduction

This chapter contains self dispatch performance data intended primarily for use by flight crews in the event that information cannot be obtained from the airline dispatch office. The takeoff data provided is for a single takeoff flap at max takeoff thrust. The range of conditions covered is limited to those normally encountered in airline operation. In the event of conflict between the data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

Takeoff

The maximum allowable takeoff weight will be the least of the Field, Climb, Obstacle, Brake Energy and Tire Speed Limit Weights as determined from the tables shown.

Brake Energy or Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Field Limit Weight - Slope and Wind Corrections

These tables for dry and wet runways provide corrections to the field length available for the effects of runway slope and wind component along the runway. Enter the appropriate table with the available field length and runway slope to determine the slope corrected field length. Next enter the appropriate table with slope corrected field length and wind component to determine the slope and wind corrected field length.

Field and Climb Limit Weight

Tables are presented for selected airport pressure altitudes and runway conditions and show both Field and Climb Limit Weights. Enter the appropriate table for pressure altitude and runway condition with “Slope and Wind Corrected Field Length” determined above and airport OAT to obtain Field Limit Weight. Also read Climb Limit Weight for the same OAT. Intermediate altitudes may be interpolated or use next higher altitude. When finding a maximum weight for a wet runway, the dry runway limit weight must also be determined and the lower of the two weights used.

Obstacle Limit Weight

The Reference Obstacle Limit Weight table provides obstacle limit weights for reference airport conditions based on obstacle height above the runway surface and distance from brake release. Enter the adjustment tables to adjust the reference Obstacle Limit Weight for the effects of OAT, pressure altitude and wind as indicated. In the case of multiple obstacles, enter the tables successively with each obstacle and determine the most limiting weight.

Tire Speed Limit

Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Maximum tire speed limited weights are presented for 225 MPH tires. To determine the tire speed limit weight, enter the table with OAT and airport pressure altitude. Adjust the tire speed limit weight according to the notes below the table to account for wind.

Brake Energy Limit VMBE

Brake Energy Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

The Maximum Brake Energy Speed table provides the Reference VMBE for a variety of airport pressure altitudes and temperatures. Enter the Weight Adjusted VMBE table to adjust the Reference VMBE for the actual brake release gross weight. Correct VMBE for slope and wind. If V1 exceeds VMBE, decrease brake release weight as indicated for each knot that V1 exceeds VMBE and determine V1, VR, and V2 for the lower brake release weight.

Enroute

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. Note that this table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Trip Fuel and Time

Long Range Cruise Trip Fuel and Time tables are provided to determine trip time and fuel required to destination.

To determine trip fuel and time for a constant altitude cruise, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the planned landing weight to obtain the adjustment to the fuel required at the planned landing weight.

Long Range Cruise Step Climb Trip Fuel and Time

The Long Range Cruise Step Climb Trip Fuel and Time tables are provided to determine trip time and fuel required to destination when flying a step climb profile. Step climb profiles are based on 4000 ft step climbs to keep the flight within 2000 ft of the optimum altitude for the current cruise weight. To determine trip fuel and time, enter the Ground to Air Miles Conversion table and determine air distance as discussed above. Then enter the Trip Fuel and Time Required table with air distance and planned landing weight to read trip fuel. Continue across the table to read trip time.

Short Trip Fuel and Time

These tables are provided to determine trip fuel and time for short distances or alternates. Obtain air distance from the table using the ground distance and wind component to the alternate. Enter the Trip Fuel and Time Required table with air distance and read trip fuel required for the expected landing weight, together with time to alternate at right. For distances greater than shown or other altitudes, use the Long Range Cruise Trip Fuel and Time tables.

Holding Planning

This table provides total fuel flow information necessary for planning flaps up holding and reserve fuel requirements. Data is based on the FMC holding speed schedule which is the higher of the maximum endurance and flaps up maneuver speeds. As noted, the fuel flow is based on flight in a racetrack holding pattern. For holding in straight and level flight, reduce table values by 5%.

Flight Crew Oxygen Requirements

This airplane is equipped with a chemical passenger oxygen system. Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. The oxygen quantity associated with the above requirements is achieved with the minimum dispatch oxygen cylinder pressure.

To determine the minimum dispatch oxygen cylinder pressure enter the appropriate flight crew oxygen table with the number of crew plus observers using oxygen and read the minimum cylinder pressure required for the appropriate cylinder temperature.

Net Level Off Weight

The Net Level Off Weight table is provided to determine terrain clearance capability in straight and level flight following an engine failure. Regulations require terrain clearance planning based on net performance which is the gross (or actual) gradient performance degraded by 1.1%. In addition, the net level off pressure altitude must clear the terrain by 1000 ft.

To determine the maximum weight for terrain clearance, enter the table with required net level off pressure altitude and expected ISA deviation to obtain weight. Adjust weight for anti-ice operation as noted below the table.

Landing

Tables are provided for determining the maximum landing weight as limited by field length or climb requirements for a single landing flap.

Maximum landing weight is the lowest of the field length limit weight, climb limit weight, or maximum certified landing weight.

Landing Field Limit Weight

For the expected runway condition and anti-skid system configuration, obtain wind corrected field length by entering the Wind Corrected Field Length table with field length available and wind component along the runway. Now enter the Field Limit Weight table with wind corrected field length and pressure altitude to read field limit weight.

Landing Climb Limit Weight

Enter the table with airport OAT and pressure altitude to read landing climb limit weight. Apply the noted adjustments as required.

Go-Around Climb Gradient

Enter the Reference Go-Around Gradient table with airport OAT and pressure altitude to determine the reference go-around gradient. Then adjust the reference gradient for airplane weight and speed using the tables provided to determine the weight and speed adjusted go-around gradient. Apply the necessary corrections for engine bleed configuration and icing conditions as noted.

Quick Turnaround Limit Weight

Enter the appropriate table (Steel or Carbon Brakes) with airport pressure altitude and OAT to read maximum quick turnaround weight. Apply the noted adjustments as required.

If the landing weight exceeds the maximum quick turnaround weight, wait the specified time and then check that the wheel thermal plugs have not melted before executing a subsequent takeoff. For Steel Brakes, the alternate procedures on the charts can be used to ensure the brake temperature is within limits. These procedures cannot be used for carbon brakes.

Gear Down

This section provides flight planning data for revenue operation with gear down. Unless otherwise noted, the gear down tables in this section are identical in format and usage to the corresponding gear up tables previously described.

To eliminate erroneous displays the flight crew should enter only gross weight data on the PERF INIT page of the Control Display Unit (CDU). Omission of the cost index and cruise altitude entries on the PERF INIT page will render the VNAV function unavailable during flight. As a result, the following information will not be provided: VNAV guidance and speed schedules, trip fuel and ETA predictions, optimum and maximum altitude data, step climb and top of descent predictions, and the VNAV descent guidance path.

The gross weight entry allows the FMCS takeoff and approach speed schedules to be generated. In addition, the flap maneuver speed and VREF speed bugs will be available for display on the primary flight display speed tape. Except for VNAV, normal autopilot and autothrottle modes will remain available for use during the flight, as will the LNAV mode.

Takeoff/Landing Climb Limit Weight

Enter the appropriate table with airport OAT and pressure altitude to determine Takeoff/Landing Climb Limit Weight with gear down. Correct the weight obtained for engine bleed configuration as required.

Performance Dispatch — Chapter PD

Table of Contents — Section 70

737-900ERW CFM56-7B26 C KG M FAA CATH/P

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

With engine bleed for packs off, increase field limit weight by 400 kg and climb limit weight by 1500 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 900 kg and climb limit weight by 1500 kg.

With engine bleed for packs off, increase field limit weight by 350 kg and climb limit weight by 1500 kg.
With engine anti-ice on, decrease field limit weight by 200 kg and climb limit weight by 250 kg.
With engine and wing anti-ice on (optional system), decrease field limit weight by 750 kg and climb limit weight by 1500 kg.

With engine bleed for packs off, increase weight by 600 kg.
With engine anti-ice on, decrease weight by 300 kg.
With engine and wing anti-ice on, decrease weight by 1650 kg (optional system).

-54	-65	86.1	86.1	86.1	86.1	86.1	85.4	81.7

Increase weight by 750 kg per 1% uphill slope. Decrease weight by 1200 kg per 1% downhill slope. Increase weight by 1850 kg per 10 knots headwind. Decrease weight by 7750 kg per 10 knots tailwind. After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 67 minutes and check that wheel thermal plugs have not melted before executing a subsequent takeoff.

As an alternate procedure, ensure that each brake pressure plate temperature, without artificial cooling, is less than 218°C as follows:
No sooner than 10 and no later than 15 minutes after parking, measure each brake pressure plate surface temperature at a minimum of two points per brake by an accurate method (using a Doric Microtemp 450 hand held thermometer or equivalent, hold temperature probe in place for 20 seconds or until reading stabilizes). If each measured temperature is less than 218°C, immediate dispatch is allowed; otherwise the required minimum ground wait period of 67 minutes applies.

If a Brake Temperature Monitoring System (BTMS) is installed:

No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 67 minutes after landing, or until all the BTMS readings on the systems Display are below 3.5 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.

Quick Turnaround Limit Weight - Category P Carbon Brakes

-50	-58	86.1	86.1	84.6	81.5	78.3	75.0
-54	-65	86.1	86.1	85.3	82.2	79.0	75.7

Increase weight by 650 kg per 1% uphill slope. Decrease weight by 1200 kg per 1% downhill slope. Increase weight by 1700 kg per 10 knots headwind. Decrease weight by 8350 kg per 10 knots tailwind. After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 48 minutes and check that wheel thermal plugs have not melted before executing a takeoff.

If a Brake Temperature Monitoring System (BTMS) is installed:

No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 48 minutes after landing, or until all the BTMS readings on the systems Display are below 3.0 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.

Performance Dispatch — Chapter PD
Text — Section 74

Introduction

This chapter contains self dispatch performance data intended primarily for use by flight crews in the event that information cannot be obtained from the airline dispatch office. The takeoff data provided is for a single takeoff flap at max takeoff thrust. The range of conditions covered is limited to those normally encountered in airline operation. In the event of conflict between the data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

Takeoff

The maximum allowable takeoff weight will be the least of the Field, Climb, Obstacle, Brake Energy and Tire Speed Limit Weights as determined from the tables shown.

Brake Energy or Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Field Limit Weight - Slope and Wind Corrections

These tables for dry and wet runways provide corrections to the field length available for the effects of runway slope and wind component along the runway. Enter the appropriate table with the available field length and runway slope to determine the slope corrected field length. Next enter the appropriate table with slope corrected field length and wind component to determine the slope and wind corrected field length.

Field and Climb Limit Weight

Tables are presented for selected airport pressure altitudes and runway conditions and show both Field and Climb Limit Weights. Enter the appropriate table for pressure altitude and runway condition with “Slope and Wind Corrected Field Length” determined above and airport OAT to obtain Field Limit Weight. Also read Climb Limit Weight for the same OAT. Intermediate altitudes may be interpolated or use next higher altitude. When finding a maximum weight for a wet runway, the dry runway limit weight must also be determined and the lower of the two weights used.

Obstacle Limit Weight

The Reference Obstacle Limit Weight table provides obstacle limit weights for reference airport conditions based on obstacle height above the runway surface and distance from brake release. Enter the adjustment tables to adjust the reference Obstacle Limit Weight for the effects of OAT, pressure altitude and wind as indicated. In the case of multiple obstacles, enter the tables successively with each obstacle and determine the most limiting weight.

Tire Speed Limit

Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Maximum tire speed limited weights are presented for 225 MPH tires. To determine the tire speed limit weight, enter the table with OAT and airport pressure altitude. Adjust the tire speed limit weight according to the notes below the table to account for wind.

Brake Energy Limit VMBE

Brake Energy Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

The Maximum Brake Energy Speed table provides the Reference VMBE for a variety of airport pressure altitudes and temperatures. Enter the Weight Adjusted VMBE table to adjust the Reference VMBE for the actual brake release gross weight. Correct VMBE for slope and wind. If V1 exceeds VMBE, decrease brake release weight as indicated for each knot that V1 exceeds VMBE and determine V1, VR, and V2 for the lower brake release weight.

Enroute

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. Note that this table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Trip Fuel and Time

Long Range Cruise Trip Fuel and Time tables are provided to determine trip time and fuel required to destination.

To determine trip fuel and time for a constant altitude cruise, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the planned landing weight to obtain the adjustment to the fuel required at the planned landing weight.

Long Range Cruise Step Climb Trip Fuel and Time

The Long Range Cruise Step Climb Trip Fuel and Time tables are provided to determine trip time and fuel required to destination when flying a step climb profile. Step climb profiles are based on 4000 ft step climbs to keep the flight within 2000 ft of the optimum altitude for the current cruise weight. To determine trip fuel and time, enter the Ground to Air Miles Conversion table and determine air distance as discussed above. Then enter the Trip Fuel and Time Required table with air distance and planned landing weight to read trip fuel. Continue across the table to read trip time.

Short Trip Fuel and Time

These tables are provided to determine trip fuel and time for short distances or alternates. Obtain air distance from the table using the ground distance and wind component to the alternate. Enter the Trip Fuel and Time Required table with air distance and read trip fuel required for the expected landing weight, together with time to alternate at right. For distances greater than shown or other altitudes, use the Long Range Cruise Trip Fuel and Time tables.

Holding Planning

This table provides total fuel flow information necessary for planning flaps up holding and reserve fuel requirements. Data is based on the FMC holding speed schedule which is the higher of the maximum endurance and flaps up maneuver speeds. As noted, the fuel flow is based on flight in a racetrack holding pattern. For holding in straight and level flight, reduce table values by 5%.

Flight Crew Oxygen Requirements

This airplane is equipped with a chemical passenger oxygen system. Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. The oxygen quantity associated with the above requirements is achieved with the minimum dispatch oxygen cylinder pressure.

To determine the minimum dispatch oxygen cylinder pressure enter the appropriate flight crew oxygen table with the number of crew plus observers using oxygen and read the minimum cylinder pressure required for the appropriate cylinder temperature.

Net Level Off Weight

The Net Level Off Weight table is provided to determine terrain clearance capability in straight and level flight following an engine failure. Regulations require terrain clearance planning based on net performance which is the gross (or actual) gradient performance degraded by 1.1%. In addition, the net level off pressure altitude must clear the terrain by 1000 ft.

To determine the maximum weight for terrain clearance, enter the table with required net level off pressure altitude and expected ISA deviation to obtain weight. Adjust weight for anti-ice operation as noted below the table.

Landing

Tables are provided for determining the maximum landing weight as limited by field length or climb requirements for a single landing flap.

Maximum landing weight is the lowest of the field length limit weight, climb limit weight, or maximum certified landing weight.

Landing Field Limit Weight

For the expected runway condition and anti-skid system configuration, obtain wind corrected field length by entering the Wind Corrected Field Length table with field length available and wind component along the runway. Now enter the Field Limit Weight table with wind corrected field length and pressure altitude to read field limit weight.

Landing Climb Limit Weight

Enter the table with airport OAT and pressure altitude to read landing climb limit weight. Apply the noted adjustments as required.

Go-Around Climb Gradient

Enter the Reference Go-Around Gradient table with airport OAT and pressure altitude to determine the reference go-around gradient. Then adjust the reference gradient for airplane weight and speed using the tables provided to determine the weight and speed adjusted go-around gradient. Apply the necessary corrections for engine bleed configuration and icing conditions as noted.

Quick Turnaround Limit Weight

Enter the appropriate table (Steel or Carbon Brakes) with airport pressure altitude and OAT to read maximum quick turnaround weight. Apply the noted adjustments as required.

If the landing weight exceeds the maximum quick turnaround weight, wait the specified time and then check that the wheel thermal plugs have not melted before executing a subsequent takeoff. For Steel Brakes, the alternate procedures on the charts can be used to ensure the brake temperature is within limits. These procedures cannot be used for carbon brakes.

Gear Down

This section provides flight planning data for revenue operation with gear down. Unless otherwise noted, the gear down tables in this section are identical in format and usage to the corresponding gear up tables previously described.

To eliminate erroneous displays the flight crew should enter only gross weight data on the PERF INIT page of the Control Display Unit (CDU). Omission of the cost index and cruise altitude entries on the PERF INIT page will render the VNAV function unavailable during flight. As a result, the following information will not be provided: VNAV guidance and speed schedules, trip fuel and ETA predictions, optimum and maximum altitude data, step climb and top of descent predictions, and the VNAV descent guidance path.

The gross weight entry allows the FMCS takeoff and approach speed schedules to be generated. In addition, the flap maneuver speed and VREF speed bugs will be available for display on the primary flight display speed tape. Except for VNAV, normal autopilot and autothrottle modes will remain available for use during the flight, as will the LNAV mode.

Takeoff/Landing Climb Limit Weight

Enter the appropriate table with airport OAT and pressure altitude to determine Takeoff/Landing Climb Limit Weight with gear down. Correct the weight obtained for engine bleed configuration as required.

Performance Dispatch — Chapter PD
Table of Contents — Section 80

737-900ERW CFM56-7B27 C FT LB FAA CATH/P

Performance Dispatch — Chapter PD
Pkg Model Identification — Section 80

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

With engine bleed for packs off, increase field limit weight by 800 lb and climb limit weight by 3300 lb.
With engine anti-ice on, decrease field limit weight by 500 lb and climb limit weight by 600 lb.
With engine and wing anti-ice on (optional system), decrease field limit weight by 2000 lb and climb limit weight by 3500 lb.

With engine bleed for packs off, increase field limit weight by 800 lb and climb limit weight by 3300 lb.
With engine anti-ice on, decrease field limit weight by 500 lb and climb limit weight by 600 lb.
With engine and wing anti-ice on (optional system), decrease field limit weight by 2000 lb and climb limit weight by 3500 lb.

Increase VMBE by 1 knot per 1% uphill runway slope. Decrease VMBE by 4 knots per 1% downhill runway slope.
Increase VMBE by 3 knots per 10 knots headwind. Decrease VMBE by 20 knots per 10 knots tailwind.
Decrease brake release weight by 1150 lb for each knot V1 exceeds VMBE.
Determine normal V1, VR, V2 speeds for lower brake release weight.

With engine bleed for packs off, increase weight by 2700 lb.
With engine anti-ice on, decrease weight by 500 lb.
With engine and wing anti-ice on, decrease weight by 3100 lb.
When operating in icing conditions during any part of the flight with forecast landing temperature below 10°C, decrease weight by 16100 lb.

**Increase weight by 1700 lb per 1% uphill slope. Decrease weight by 2600 lb per 1% downhill slope.
Increase weight by 4100 lb per 10 knots headwind. Decrease weight by 17000 lb per 10 knots tailwind.
After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 67 minutes and check that wheel thermal plugs have not melted before executing a subsequent takeoff.**

**As an alternate procedure, ensure that each brake pressure plate temperature, without artificial cooling, is less than 218°C as follows:
No sooner than 10 and no later than 15 minutes after parking, measure each brake pressure plate surface temperature at a minimum of two points per brake by an accurate method (using a Doric Microtemp 450 hand held thermometer or equivalent, hold temperature probe in place for 20 seconds or until reading stabilizes). If each measured temperature is less than 218°C, immediate dispatch is allowed; otherwise the required minimum ground wait period of 67 minutes applies.**

If a Brake Temperature Monitoring System (BTMS) is installed:

**No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 67 minutes after landing, or until all the BTMS readings on the systems Display are below 3.5 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.**

**Increase weight by 1400 lb per 1% uphill slope. Decrease weight by 2700 lb per 1% downhill slope.
Increase weight by 3700 lb per 10 knots headwind. Decrease weight by 18400 lb per 10 knots tailwind.
After landing at weights exceeding those shown above, adjusted for slope and wind, wait at least 48 minutes and check that wheel thermal plugs have not melted before executing a takeoff.**

If a Brake Temperature Monitoring System (BTMS) is installed:

**No sooner than 10 and no later than 15 minutes after parking, check the BRAKE TEMP light. If the BRAKE TEMP light is not on, no ground waiting period is required. If the BRAKE TEMP light is on, do not dispatch until at least 48 minutes after landing, or until all the BTMS readings on the systems Display are below 3.0 and the BRAKE TEMP light is off. Check that wheel thermal plugs have not melted before making a subsequent takeoff.
Note: If any brake temperature display digit is blank or indicates 0.0 or 0.1, then this method cannot be used.**

Intentionally
Blank

Performance Dispatch — Chapter PD

Performance Dispatch — Chapter PD

Text — Section 84

Introduction

This chapter contains self dispatch performance data intended primarily for use by flight crews in the event that information cannot be obtained from the airline dispatch office. The takeoff data provided is for a single takeoff flap at max takeoff thrust. The range of conditions covered is limited to those normally encountered in airline operation. In the event of conflict between the data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

Takeoff

The maximum allowable takeoff weight will be the least of the Field, Climb, Obstacle, Brake Energy and Tire Speed Limit Weights as determined from the tables shown.

Brake Energy or Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Field Limit Weight - Slope and Wind Corrections

These tables for dry and wet runways provide corrections to the field length available for the effects of runway slope and wind component along the runway. Enter the appropriate table with the available field length and runway slope to determine the slope corrected field length. Next enter the appropriate table with slope corrected field length and wind component to determine the slope and wind corrected field length.

Field and Climb Limit Weight

Tables are presented for selected airport pressure altitudes and runway conditions and show both Field and Climb Limit Weights. Enter the appropriate table for pressure altitude and runway condition with “Slope and Wind Corrected Field Length” determined above and airport OAT to obtain Field Limit Weight. Also read Climb Limit Weight for the same OAT. Intermediate altitudes may be interpolated or use next higher altitude. When finding a maximum weight for a wet runway, the dry runway limit weight must also be determined and the lower of the two weights used.

Obstacle Limit Weight

The Reference Obstacle Limit Weight table provides obstacle limit weights for reference airport conditions based on obstacle height above the runway surface and distance from brake release. Enter the adjustment tables to adjust the reference Obstacle Limit Weight for the effects of OAT, pressure altitude and wind as indicated. In the case of multiple obstacles, enter the tables successively with each obstacle and determine the most limiting weight.

Tire Speed Limit

Tire Speed Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

Maximum tire speed limited weights are presented for 225 MPH tires. To determine the tire speed limit weight, enter the table with OAT and airport pressure altitude. Adjust the tire speed limit weight according to the notes below the table to account for wind.

Brake Energy Limit VMBE

Brake Energy Limit Weight tables are only provided if they are limiting for the range of conditions covered in the FCOM Section PD.

The Maximum Brake Energy Speed table provides the Reference VMBE for a variety of airport pressure altitudes and temperatures. Enter the Weight Adjusted VMBE table to adjust the Reference VMBE for the actual brake release gross weight. Correct VMBE for slope and wind. If V1 exceeds VMBE, decrease brake release weight as indicated for each knot that V1 exceeds VMBE and determine V1, VR, and V2 for the lower brake release weight.

Enroute

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. Note that this table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Trip Fuel and Time

Long Range Cruise Trip Fuel and Time tables are provided to determine trip time and fuel required to destination.

To determine trip fuel and time for a constant altitude cruise, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the planned landing weight to obtain the adjustment to the fuel required at the planned landing weight.

Long Range Cruise Step Climb Trip Fuel and Time

The Long Range Cruise Step Climb Trip Fuel and Time tables are provided to determine trip time and fuel required to destination when flying a step climb profile. Step climb profiles are based on 4000 ft step climbs to keep the flight within 2000 ft of the optimum altitude for the current cruise weight. To determine trip fuel and time, enter the Ground to Air Miles Conversion table and determine air distance as discussed above. Then enter the Trip Fuel and Time Required table with air distance and planned landing weight to read trip fuel. Continue across the table to read trip time.

Short Trip Fuel and Time

These tables are provided to determine trip fuel and time for short distances or alternates. Obtain air distance from the table using the ground distance and wind component to the alternate. Enter the Trip Fuel and Time Required table with air distance and read trip fuel required for the expected landing weight, together with time to alternate at right. For distances greater than shown or other altitudes, use the Long Range Cruise Trip Fuel and Time tables.

Holding Planning

This table provides total fuel flow information necessary for planning flaps up holding and reserve fuel requirements. Data is based on the FMC holding speed schedule which is the higher of the maximum endurance and flaps up maneuver speeds. As noted, the fuel flow is based on flight in a racetrack holding pattern. For holding in straight and level flight, reduce table values by 5%.

Flight Crew Oxygen Requirements

This airplane is equipped with a chemical passenger oxygen system. Regulations require that sufficient oxygen be provided to the flight crew to account for the greater of supplemental breathing oxygen in the event of a cabin depressurization or protective breathing in the event of smoke or harmful fumes in the flight deck. The oxygen quantity associated with the above requirements is achieved with the minimum dispatch oxygen cylinder pressure.

To determine the minimum dispatch oxygen cylinder pressure enter the appropriate flight crew oxygen table with the number of crew plus observers using oxygen and read the minimum cylinder pressure required for the appropriate cylinder temperature.

Net Level Off Weight

The Net Level Off Weight table is provided to determine terrain clearance capability in straight and level flight following an engine failure. Regulations require terrain clearance planning based on net performance which is the gross (or actual) gradient performance degraded by 1.1%. In addition, the net level off pressure altitude must clear the terrain by 1000 ft.

To determine the maximum weight for terrain clearance, enter the table with required net level off pressure altitude and expected ISA deviation to obtain weight. Adjust weight for anti-ice operation as noted below the table.

Landing

Tables are provided for determining the maximum landing weight as limited by field length or climb requirements for a single landing flap.

Maximum landing weight is the lowest of the field length limit weight, climb limit weight, or maximum certified landing weight.

Landing Field Limit Weight

For the expected runway condition and anti-skid system configuration, obtain wind corrected field length by entering the Wind Corrected Field Length table with field length available and wind component along the runway. Now enter the Field Limit Weight table with wind corrected field length and pressure altitude to read field limit weight.

Landing Climb Limit Weight

Enter the table with airport OAT and pressure altitude to read landing climb limit weight. Apply the noted adjustments as required.

Go-Around Climb Gradient

Enter the Reference Go-Around Gradient table with airport OAT and pressure altitude to determine the reference go-around gradient. Then adjust the reference gradient for airplane weight and speed using the tables provided to determine the weight and speed adjusted go-around gradient. Apply the necessary corrections for engine bleed configuration and icing conditions as noted.

Quick Turnaround Limit Weight

Enter the appropriate table (Steel or Carbon Brakes) with airport pressure altitude and OAT to read maximum quick turnaround weight. Apply the noted adjustments as required.

If the landing weight exceeds the maximum quick turnaround weight, wait the specified time and then check that the wheel thermal plugs have not melted before executing a subsequent takeoff. For Steel Brakes, the alternate procedures on the charts can be used to ensure the brake temperature is within limits. These procedures cannot be used for carbon brakes.

Gear Down

This section provides flight planning data for revenue operation with gear down. Unless otherwise noted, the gear down tables in this section are identical in format and usage to the corresponding gear up tables previously described.

To eliminate erroneous displays the flight crew should enter only gross weight data on the PERF INIT page of the Control Display Unit (CDU). Omission of the cost index and cruise altitude entries on the PERF INIT page will render the VNAV function unavailable during flight. As a result, the following information will not be provided: VNAV guidance and speed schedules, trip fuel and ETA predictions, optimum and maximum altitude data, step climb and top of descent predictions, and the VNAV descent guidance path.

The gross weight entry allows the FMCS takeoff and approach speed schedules to be generated. In addition, the flap maneuver speed and VREF speed bugs will be available for display on the primary flight display speed tape. Except for VNAV, normal autopilot and autothrottle modes will remain available for use during the flight, as will the LNAV mode.

Takeoff/Landing Climb Limit Weight

Enter the appropriate table with airport OAT and pressure altitude to determine Takeoff/Landing Climb Limit Weight with gear down. Correct the weight obtained for engine bleed configuration as required.

Pkg Model Identification — Section 10

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

1. **Obtain V1, VR and V2 for the actual weight using the Dry Runway Takeoff Speeds table.**
2. **If V1(MCG) limited, set V1 = V1(MCG). If not V1(MCG) limited, enter V1 Adjustment table with the actual weight to obtain V1 speed adjustment. If adjusted V1 is less than V1(MCG), set V1 = V1(MCG). V1 not to exceed VR.**

Takeoff %N1

1. **Determine Maximum Assumed Temperature allowed from Table 1.**
2. **Find Maximum %N1 from Table 2 using the desired assumed temperature (no greater than temperature from Table 1).**
3. **Use the difference between assumed temperature and OAT to determine the %N1 adjustment from Table 3.**
4. **Subtract %N1 adjustment from Maximum %N1 in Table 2.**

1. **Determine Maximum Assumed Temperature allowed from Table 1.**
2. **Find Maximum %N1 from Table 2 using the desired assumed temperature (no greater than temperature from Table 1).**
3. **Use the difference between assumed temperature and OAT to determine the %N1 adjustment from Table 3.**
4. **Subtract %N1 adjustment from Maximum %N1 in Table 2.**

1. **Enter Weight Adjustment table with slush/standing water depth and 18K Derate dry field/obstacle limit weight to obtain slush/standing water weight adjustment.**
2. **Adjust field length available by -35 m/+30 m for every 5°C above/below 4°C.**
3. **Find V1(MCG) limit weight for adjusted field length and pressure altitude.**
4. **Max allowable slush/standing water limited weight is lesser of weights from 1 and 3.**

1. **Determine Maximum Assumed Temperature allowed from Table 1.**
2. **Find Maximum %N1 from Table 2 using the desired assumed temperature (no greater than temperature from Table 1).**
3. **Use the difference between assumed temperature and OAT to determine the %N1 adjustment from Table 3.**
4. **Subtract %N1 adjustment from Maximum %N1 in Table 2.**

Max Climb %N1

25	50	59	68	76	82	87	89	89

The above wind factor tables are for calculation of wind required to maintain present range capability at new pressure altitude, i.e., break-even wind.

Method:

1. **Read wind factors for present and new altitudes from table.**
2. **Determine difference (new altitude wind factor minus present altitude wind factor); this difference may be negative or positive.**
3. **Break-even wind at new altitude is present altitude wind plus difference from step 2.**

Descent

Reference distance is based on sea level, standard day, no wind or slope, VREF15, two-engine detent No. 2 reverse thrust, and auto speedbrakes.
For max manual braking and manual speedbrakes, increase reference landing distance by 50 m.
For autobrake and manual speedbrakes, increase reference landing distance by 40 m.
Reference Distance includes an air distance allowance of 305 m from threshold to touchdown.
Actual (unfactored) distances are shown.

***For landing distance at or below 8000 ft pressure altitude, apply the STD adjustment. For altitudes higher than 8000 ft, first apply the STD adjustment to derive a new reference landing distance for 8000 ft then apply the HIGH adjustment to this new reference distance.**

AUTOBRAKE MAX	2000	165/-155	65/95	-125/480	160/-105	50/-55	70	395	1130
AUTOBRAKE 3	2000	165/-155	65/95	-125/480	160/-100	50/-55	80	395	1130

Reference distance is based on sea level, standard day, no wind or slope, and maximum available reverse thrust.
MAX MANUAL assumes maximum achievable manual braking.
Reference Distance includes an air distance allowance of 305 m from threshold to touchdown.
Actual (unfactored) distances are shown.

***For landing distance at or below 8000 ft pressure altitude, apply the STD adjustment. For altitudes higher than 8000 ft, first apply the STD adjustment to derive a new reference landing distance for 8000 ft then apply the HIGH adjustment to this new reference distance.**

Observe maximum quick turnaround limit.

Table shows energy per brake added by a single stop with all brakes operating. Energy is assumed to be equally distributed among the operating brakes. Total energy is the sum of residual energy plus energy added.

Add 1.0 million foot pounds per brake for each taxi mile.

When in caution zone, wheel fuse plugs may melt. Delay takeoff and inspect after one hour. If overheat occurs after takeoff, extend gear soon for at least 7 minutes.

When in fuse plug melt zone, clear runway immediately. Unless required, do not set parking brake. Do not approach gear or attempt to taxi for one hour. Tire, wheel and brake replacement may be required. If overheat occurs after takeoff, extend gear soon for at least 12 minutes.

Brake temperature monitor system (BTMS) indication on CDS systems page may be used 10 to 15 minutes after airplane has come to a complete stop or inflight with gear retracted to determine recommended cooling schedule.

This table includes 5% additional fuel for holding in a racetrack pattern.

Performance Inflight — Chapter PI
Text — Section 16

Introduction

This chapter contains information to supplement performance data from the Flight Management Computer (FMC). In addition, sufficient inflight data is provided to complete a flight with the FMC inoperative. In the event of conflict between data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

General

Takeoff Speeds

The speeds presented in the Takeoff Speeds table as well as FMC computed takeoff speeds can be used for all performance conditions except where adjustments must be made for anti-skid inoperative, thrust reversers inoperative, improved climb, contaminated runway situations, or brake energy limits.

V1 adjustments are not necessary for equal amounts of clearway and stopway. V1 for takeoff limit weights based on unequal clearway and stopway should be obtained from computerized takeoff speeds calculations for the specific takeoff conditions.

These speeds may be used for weights less than or equal to the performance limited weight subject to the restrictions noted above.

The FMC will protect for minimum control speeds by increasing V1, VR and V2 as required. However, the FMC will not compute takeoff speeds for weights where the required speed increase exceeds the maximum certified speed increase. This typically occurs at full rated thrust and light weights. In this case, the message "V SPEEDS UNAVAILABLE" will appear on the FMC scratchpad and the takeoff speed entries will be blank. In this situation, manually verify takeoff speeds using an approved source of takeoff performance information. Upon verifying the takeoff speeds, takeoff is permitted. When selected takeoff speeds cannot be verified, the options are to select a lower number flap setting, select derate thrust and/or increase airplane gross weight (e.g. add fuel). Selecting derate thrust is the preferred method as this will reduce the minimum control speeds. Note that the assumed temperature method will not help this condition as the minimum control speeds are determined at the actual temperature and therefore are not reduced by an assumed temperature selection.

Normal takeoff speeds, V1, VR, and V2 are read from either the dry or wet table by entering with takeoff flap setting and brake release weight. Use the tables provided to adjust takeoff speeds for altitude and actual temperature or assumed temperature for reduced thrust takeoffs. Slope and wind adjustments to V1 are obtained by entering the Slope and Wind V1 Adjustment table.

V1(MCG)

Regulations prohibit scheduling takeoff with a V1 less than minimum V1 for control on the ground, V1(MCG). It is therefore necessary to compare the adjusted V1 to V1(MCG). The V1(MCG) presented in this manual is conservative for all weight and bleed configurations.

To find V1(MCG) enter the V1(MCG) table with the airport pressure altitude and actual OAT. If the adjusted V1 is less than V1(MCG), set V1 equal to V1(MCG). If the adjusted VR is less than V1(MCG), set VR equal to V1(MCG), and determine a new V2 by adding the difference between the normal VR and V1(MCG) to the normal V2. No takeoff weight adjustment is necessary provided that the actual field length exceeds the minimum field length shown in the Field and Climb Limit Weight table in chapter Performance Dispatch.

Stab Trim

To find takeoff stabilizer trim setting, enter Stab Trim Setting table with anticipated brake release weight and center of gravity (C.G. % MAC) and read required stabilizer trim units.

VREF

This table contains flaps 40, 30 and 15 reference speeds for a given weight.

Flap Maneuver Speeds

This table provides flap maneuver speeds for various flap settings. During flap retraction, selection of the next flap position is initiated when reaching the maneuver speed for the existing flap position. During flap retraction, at least adequate maneuver capability or 30° of bank (15° of bank and 15° overshoot) to stick shaker is provided at the flap retraction speed. Full maneuver capability or at least 40° of bank (25° of bank and 15° overshoot) is provided when the airplane has accelerated to the recommended maneuver speed for the selected flap position.

During flap extension, selection of the flaps to the next flap position should be made when approaching, and before decelerating below, the maneuver speed for the existing flap position. The flap extension speed schedule varies with airplane weight and provides full maneuver capability or at least 40° of bank (25° of bank and 15° overshoot) to stick shaker at all weights.

Slush/Standing Water Takeoff

Experience has shown that aircraft performance may deteriorate significantly on runways covered with snow, slush, standing water or ice. Therefore, reductions in field/obstacle limited takeoff weight and revised takeoff speeds are necessary. The tables are intended for guidance in accordance with advisory material and assume an engine failure at the critical point during the takeoff.

The entire runway is assumed to be completely covered by a contaminant of uniform thickness and density. Therefore this information is conservative when operating under typical cold weather conditions where patches of slush exist and some degree of sanding is common. Takeoffs in slush or standing water depths greater than 13 mm (0.5 inches) are not recommended because of possible airplane damage as a result of spray impingement on the airplane structure. The use of assumed temperature for reduced thrust is not allowed on contaminated runways. Interpolation for slush/standing water depths between the values shown is permitted.

Takeoff weight determination:

1. Enter the Weight Adjustment table with the dry field/obstacle limit weight to obtain the weight reduction for the slush/standing water depth and airport pressure altitude.
2. Adjust field length available for temperature by amount shown beneath V1(MCG) limit weight table.
3. Enter the V1(MCG) Limit Weight table with the adjusted field length and pressure altitude to obtain the slush/standing water limit weight with respect to minimum field length required for V1(MCG) speed.
4. The maximum allowable takeoff weight in slush/standing water is the lesser of the limit weights found in steps 1 and 3.

Takeoff speed determination:

1. Determine takeoff speeds V1, VR and V2 for actual brake release weight using the Dry Runway Takeoff Speeds table for the appropriate flap setting and thrust rating.
2. If V1(MCG) limited, set V1=V1(MCG). If not limited by V1(MCG) considerations, enter the V1 Adjustment table with actual brake release weight to determine the V1 reduction to apply to V1 speed. If the adjusted V1 is less than V1(MCG), set V1=V1(MCG).

Slippery Runway Takeoff

Airplane braking action is reported as good, medium or poor, depending on existing runway conditions. If braking action is reported as good, conditions should not be expected to be as good as on clean, dry runways. The value “good” is comparative and is intended to mean that airplanes should not experience braking or directional control difficulties when stopping. The performance level used to calculate the “good” data is consistent with wet runway testing done on early Boeing jets. The performance level used to calculate the “poor” data reflects a runway covered with wet ice. Performance is based on a 15 ft screen height at the end of the runway. The tables provided are used in the same manner as the Slush/Standing Water tables.

Anti-Skid Inoperative

When operating with anti-skid inoperative, the field limit weight and V1 must be reduced to account for the effect on accelerate-stop performance. Anti-skid inoperative is only allowed on a dry runway. A simplified method which conservatively accounts for the effects of anti-skid inoperative is to reduce the normal dry field/obstacle limited weight by 7050 kg and the V1 associated with the reduced weight by the amount shown in the table below.

ANTI-SKID INOPERATIVE V1 ADJUSTMENTS	
FIELD LENGTH (M)	V1 ADJUSTMENT (KIAS)
2000	-16
2500	-14
3000	-12
3500	-11
4000	-10

If the resulting V1 is less than V1(MCG), takeoff is permitted with V1 set equal to V1(MCG) provided the dry accelerate-stop distance adjusted for wind and slope exceeds approximately 2300 m.

Detailed analysis for the specific case from the Airplane Flight Manual may yield a less restrictive penalty.

Thrust Reverser Inoperative

When dispatching on a wet runway with both thrust reversers operative, an operative anti-skid system, and all brakes operating, regulations allow deceleration credit for one thrust reverser in the engine failure case and two thrust reversers in the all engine stop case.

When dispatching on a wet runway with one thrust reverser inoperative, the field/obstacle limited weight and V1 speed must be reduced to account for the effect on accelerate-stop performance. A simplified method, which conservatively accounts for this, is to reduce the normal wet runway/field/obstacle limited weight by 1000 kg and the V1 associated with the reduced weight by 2 knots.

If the resulting V1 is less than minimum V1, takeoff is permitted with V1 set equal to V1(MCG) provided the accelerate-stop distance available adjusted for wind and slope exceeds approximately 1650 m.

Detailed analysis for the specific case from the Airplane Flight Manual may yield a less restrictive penalty.

Takeoff %N1

To find Max Takeoff %N1 based on normal engine bleed for air conditioning packs on, enter Takeoff %N1 Table with airport pressure altitude and airport OAT and read %N1. Apply %N1 adjustments as provided when applicable.

Assumed Temperature Reduced Thrust

Regulations permit the use of up to 25% takeoff thrust reduction for operation with assumed temperature reduced thrust. Use of assumed temperature reduced thrust is not allowed with anti-skid inoperative or on runways contaminated with standing water, ice, slush, or snow. Use of assumed temperature reduced thrust is not recommended if potential windshear conditions exist.

To find the maximum allowable assumed temperature enter the Maximum Assumed Temperature table with airport pressure altitude and OAT. Compare this temperature to that at which the airplane is performance limited as determined from available takeoff performance data. Next, enter the Maximum Takeoff %N1 table with airport pressure altitude and the lower of the two temperatures previously determined, to obtain a maximum takeoff %N1. Do not use an assumed temperature less than the minimum assumed temperature shown. Enter the %N1 Adjustment table with OAT and the difference between the assumed and actual OAT to obtain a %N1 adjustment. Subtract the %N1 adjustment from the maximum takeoff %N1 found previously to determine the assumed temperature reduced thrust %N1.

Apply %N1 adjustments as provided when applicable.

Max Climb %N1

This table shows Max Climb %N1 for a 280/.78 climb speed schedule, normal engine bleed for packs on or off and anti-ice off. Enter the table with airport pressure altitude and TAT and read %N1. %N1 adjustments are shown for anti-ice operation.

Go-around %N1

To find Max Go-around %N1 based on normal engine bleed for packs on (AUTO) and anti-ice on or off, enter the Go-around %N1 table with airport pressure altitude and reported OAT or TAT and read %N1. For packs OFF or HIGH operation, apply the %N1 adjustment shown below the table.

Flight with Unreliable Airspeed / Turbulent Air Penetration

Pitch attitude and average %N1 information is provided for use in all phases of flight in the event of unreliable airspeed/Mach indications resulting from blocking or freezing of the pitot system. Loss of radome or turbulent air may also cause unreliable airspeed/Mach indications. The cruise table in this section may also be used for turbulent air penetration.

Pitch attitude is shown in bold type for emphasis since altitude and/or vertical speed indications may also be unreliable.

All Engines

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. This table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Control

These tables provide target %N1, Long Range Cruise Mach number, IAS and standard day fuel flow per engine for the airplane weight and pressure altitude. As indicated by the shaded area, at optimum altitude .79M approximates the Long Range Cruise Mach schedule.

Long Range Cruise Enroute Fuel and Time

Long Range Cruise Enroute Fuel and Time tables are provided to determine remaining time and fuel required to destination. The data is based on Long Range Cruise and .78/280/250 descent. Tables are presented for low altitudes and high altitudes.

To determine remaining fuel and time required, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the actual weight at checkpoint to obtain fuel required to destination.

APU Operation During Flight

For APU operation during flight, increase fuel flow according to the table in the Engine Inoperative text section.

Long Range Cruise Wind-Altitude Trade

Wind is a factor which may justify operations considerably below optimum altitude. For example, a favorable wind component may have an effect on ground speed which more than compensates for the loss in air range.

Using this table, it is possible to determine the break-even wind (advantage necessary or disadvantage that can be tolerated) to maintain the same range at another altitude and long range cruise speed. The tables make no allowance for climb or descent time, fuel or distance, and are based on comparing ground fuel mileage.

Descent

Time, fuel, and distance for descent are shown for a .78/280/250 descent speed schedule. Enter the table with top of descent pressure altitude and read distance, time and fuel. Data is based on flight idle thrust descent in zero wind. Allowances are included for a straight-in approach with gear down and landing flaps at the outer marker.

Holding

Target %N1, indicated airspeed and fuel flow per engine information is tabulated for holding with flaps up based on the FMC optimum holding speed schedule. This is the higher of the maximum endurance speed and the maneuvering speed. Small variations in airspeed will not appreciably affect the overall endurance time. Enter the table with weight and pressure altitude to read %N1, IAS and fuel flow per engine.

Advisory Information

Normal Configuration Landing Distance

The normal configuration distance tables are provided as advisory information to help determine the actual landing distance performance of the airplane for different runway surface conditions and brake configurations.

Flaps 15, 30, and 40 landing distances and adjustments are provided for dry runways as well as runways with good, medium, and poor reported braking action, which are commonly referred to as slippery runway conditions.

If the surface is affected by water, snow or ice, and the braking action is reported as "good", conditions should not be expected to be as good as on clean, dry runways. The value "good" is comparative and is intended to mean that airplanes should not experience braking or directional control difficulties when landing. The performance level used to calculate the "good" data is consistent with wet runway testing done on early Boeing jets. The performance level used to calculate "poor" data reflects runways covered with wet ice.

Dry runway landing performance is shown for max manual braking configuration and autobrake settings max, 3, 2, and 1. The autobrake performance may be used to assist in the selection of the most desirable autobrake setting for a given field length. Selection of an autobrake setting results in a constant rate of deceleration. Maximum effort manual braking should achieve shorter landing distance than the max autobrake setting. The reference landing distance is a reference distance from 50 ft above the threshold to stop based on a reference landing weight and normal approach speed for the selected landing flap at sea level, zero wind, zero slope, and two engine detent reverse thrust. Subsequent columns provide adjustments for off-reference landing weight, altitude, wind, slope, temperature, speed, and reverse thrust. Each adjustment is independently added to the reference landing distance.

Non-normal Configuration Landing Distance

Advisory information is provided to support non-normal configurations that affect the landing performance of the airplane. Landing distances and adjustments are provided for dry runways and runways with good, medium, and poor reported braking action.

Enter the table with the applicable non-normal configuration and read the normal approach speed. The reference landing distance is a reference distance from 50 ft above the threshold to stop based on a reference landing weight and speed at sea level, zero wind, and zero slope. Subsequent columns provide adjustments for off-reference landing weight, altitude, wind, slope, and speed conditions. Each adjustment is independently added to the reference landing distance. Landing distance includes the effect of reverse thrust.

Recommended Brake Cooling Schedule

Advisory information is provided to assist in avoiding the problems associated with hot brakes. For normal operation, most landings are at weights below the AFM quick turnaround limit weight.

Use of the recommended cooling schedule will help avoid brake overheat and fuse plug problems that could result from repeated landings at short time intervals or a rejected takeoff.

Enter the Recommended Brake Cooling Schedule table with the airplane weight and brakes on speed, adjusted for wind at the appropriate temperature and altitude condition. Instructions for applying wind adjustments are included below the table. Linear interpolation may be used to obtain intermediate values. The resulting number is the reference brake energy per brake in millions of foot-pounds, and represents the amount of energy absorbed by each brake during a rejected takeoff. Notes providing adjustments for wind are included below the table.

To determine the energy per brake absorbed during landing, enter the appropriate Adjusted Brake Energy Per Brake table (No Reverse Thrust or 2 Engine Reverse) with the reference brake energy per brake and the type of braking used during landing (Max Manual, Max Auto, or Autobrake). The resulting number is the adjusted brake energy per brake and represents the energy absorbed in each brake during the landing.

The recommended cooling time is found in the appropriate (steel or carbon brakes) final table by entering with the adjusted brake energy per brake. Times are provided for ground cooling and inflight gear down cooling.

Brake Temperature Monitor System (BTMS) indications are also shown. If brake cooling is determined from the BTMS, use the hottest brake indication 10 to 15 minutes after the airplane has come to a complete stop, or inflight with gear retracted to determine recommended cooling schedule.

Engine Inoperative

Initial Max Continuous %N1

The Initial Max Continuous %N1 setting for use following an engine failure is shown. The table is based on the typical all engine cruise speed of .79M to provide a target %N1 setting at the start of driftdown. Once driftdown is established, the Max Continuous %N1 table should be used to determine %N1 for the given conditions.

Max Continuous %N1

Power setting is based on one engine operating with one A/C pack operating and all anti-ice bleeds off. Enter the table with pressure altitude, TAT, and IAS or Mach to read %N1.

It is desirable to maintain engine thrust level within the limits of the Max Cruise thrust rating. However, where thrust level in excess of Max Cruise rating is required, such as for meeting terrain clearance, ATC altitude assignments, or to attain maximum range capability, it is permissible to use the thrust needed up to the Max Continuous thrust rating. The Max Continuous thrust rating is intended primarily for emergency use at the discretion of the pilot and is the maximum thrust that may be used continuously.

Driftdown Speed/Level Off Altitude

The table shows optimum driftdown speed as a function of cruise weight at start of driftdown. Also shown are the approximate weight and pressure altitude at which the airplane will level off considering 100 ft/min residual rate of climb.

The level off altitude is dependent on air temperature (ISA deviation).

Driftdown/LRC Range Capability

This table shows the range capability from the start of driftdown. Driftdown is continued to level off altitude. As weight decreases due to fuel burn, the airplane is accelerated to Long Range Cruise speed. Cruise is continued at level off altitude and Long Range Cruise speed.

To determine fuel required, enter the Ground to Air Miles Conversion table with the desired ground distance and adjust for anticipated winds to obtain air distance to destination. Then enter the Driftdown/Cruise Fuel and Time table with air distance and weight at start of driftdown to determine fuel and time required. If altitudes other than the level off altitude is used, fuel and time required may be obtained by using the Engine Inoperative Long Range Cruise Enroute Fuel and Time table.

Long Range Cruise Altitude Capability

The table shows the maximum altitude that can be maintained at a given weight and air temperature (ISA deviation), based on Long Range Cruise speed, Max Continuous thrust, and 100 ft/min residual rate of climb.

Long Range Cruise Control

The table provides target %N1, engine inoperative Long Range Cruise Mach number, IAS and fuel flow for the airplane weight and pressure altitude. The fuel flow values in this table reflect single engine fuel burn.

APU Operation During Flight

For APU operation during flight, increase fuel flow according to the following table. These increments include the APU fuel flow and the effect of increased drag from the APU door.

PRESSURE ALTITUDE (1000 FT)	APU FUEL FLOW (KG/HR)
39	45
35	45
31	50
25	60
20	65
15	75
10	85
5	95

Long Range Cruise Diversion Fuel and Time

Tables are provided for crews to determine the fuel and time required to proceed to an alternate airfield with one engine inoperative. The data is based on single engine Long Range Cruise speed and .78/280/250 descent. Enter with Air Distance as determined from the Ground to Air Miles Conversion table and read Fuel and Time required at the cruise pressure altitude. Adjust the fuel obtained for deviation from the reference weight at checkpoint as required by entering the off reference fuel adjustments table with the fuel required for the reference weight and the actual weight at checkpoint. Read fuel required and time for the actual weight.

Holding

Single engine holding data is provided in the same format as the all engine holding data and is based on the same assumptions.

Gear Down Landing Rate of Climb Available

Rate of climb data is provided as guidance information in the event an engine inoperative landing (manual or autoland) is planned. The tables show gear down rate of climb available for Flaps 15 and Flaps 30. Enter the table with TAT and pressure altitude to read rate of climb available. Apply adjustments shown to correct for weight.

Alternate Mode EEC

Introduction

No takeoff speed adjustments or other performance adjustments are required of Electronic Engine Control (EEC) in the alternate mode (ALTN EEC switch illuminated) for the 7B18, -7B20, -7B22, -7B24 and -7B24A engine thrust ratings.

Operation with derate and/or assumed temperature reduced thrust is not permitted with the EEC in alternate mode.

Gear Down

This section contains performance for airplane operation with the landing gear extended. The data is based on engine bleeds for normal air conditioning.

Note: The Flight Management Computer System (FMCS) does not contain special provisions for operation with landing gear extended. As a result, the FMCS may generate inappropriate enroute speed schedules, display non-conservative predictions of fuel burn, estimated time of arrival (ETA), maximum altitude, and compute overly shallow descent path. An accurate estimated time of arrival (ETA) is available if current speed or Mach is entered into the VNAV cruise page.

Tables for gear down performance in this section are identical in format and used in the same manner as tables for the gear up configuration previously described.

Performance Inflight — Chapter PI
Pkg Model Identification — Section 20

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

1. **Obtain V1, VR and V2 for the actual weight using the Dry Runway Takeoff Speeds table.**
2. **If V1(MCG) limited, set V1 = V1(MCG). If not V1(MCG) limited, enter V1 Adjustment table with the actual weight to obtain V1 speed adjustment. If adjusted V1 is less than V1(MCG), set V1 = V1(MCG). V1 not to exceed VR.**

Takeoff %N1

1. **Determine Maximum Assumed Temperature allowed from Table 1.**
2. **Find Maximum %N1 from Table 2 using the desired assumed temperature (no greater than temperature from Table 1).**
3. **Use the difference between assumed temperature and OAT to determine the %N1 adjustment from Table 3.**
4. **Subtract %N1 adjustment from Maximum %N1 in Table 2.**

1. **Enter Weight Adjustment table with reported braking action and 22K Derate dry field/obstacle limit weight to obtain slippery runway weight adjustment.**
2. **Adjust "Good" field length available by -90 ft/+80 ft for every 5°C above/below 4°C.**
   Adjust "Medium" field length available by -90 ft/+80 ft for every 5°C above/below 4°C.
   Adjust "Poor" field length available by -130 ft/+120 ft for every 5°C above/below 4°C.
3. **Find V1(MCG) limit weight for adjusted field length and pressure altitude.**
4. **Max allowable slippery runway limited weight is lesser of weights from 1 and 3.**

1. **Enter Weight Adjustment table with slush/standing water depth and 20K Derate dry field/obstacle limit weight to obtain slush/standing water weight adjustment.**
2. **Adjust field length available by -100 ft/+90 ft for every 5°C above/below 4°C.**
3. **Find V1(MCG) limit weight for adjusted field length and pressure altitude.**
4. **Max allowable slush/standing water limited weight is lesser of weights from 1 and 3.**

1. **Enter Weight Adjustment table with slush/standing water depth and 20K Derate dry field/obstacle limit weight to obtain slush/standing water weight adjustment.**
2. **Adjust field length available by -120 ft/+110 ft for every 5°C above/below 4°C.**
3. **Find V1(MCG) limit weight for adjusted field length and pressure altitude.**
4. **Max allowable slush/standing water limited weight is lesser of weights from 1 and 3.**

1. **Determine Maximum Assumed Temperature allowed from Table 1.**
2. **Find Maximum %N1 from Table 2 using the desired assumed temperature (no greater than temperature from Table 1).**
3. **Use the difference between assumed temperature and OAT to determine the %N1 adjustment from Table 3.**
4. **Subtract %N1 adjustment from Maximum %N1 in Table 2.**

Max Climb %N1

Based on engine bleed for packs on or off and anti-ice off

Only authorized operators may use Flaps 5 for a Go-Around in conjunction with the Alternate Go-Around and Missed Approach Procedure.

Flight With Unreliable Airspeed / Turbulent Air Penetration

Altitude and/or vertical speed indications may also be unreliable.

The above wind factor table is for calculation of wind required to maintain present range capability at new pressure altitude, i.e., break-even wind.

Method:

1. **Read wind factors for present and new altitudes from table.**
2. **Determine difference (new altitude wind factor minus present altitude wind factor); This difference may be negative or positive.**
3. **Break-even wind at new altitude is present altitude wind plus difference from step 2.**

Descent

Reference distance is based on sea level, standard day, no wind or slope, VREF15, two-engine detent No. 2 reverse thrust, and auto speedbrakes.
For max manual braking and manual speedbrakes, increase reference landing distance by 180 ft.
For autobrake and manual speedbrakes, increase reference landing distance by 150 ft.
Reference Distance includes an air distance allowance of 1000 ft from threshold to touchdown.
Actual (unfactored) distances are shown.

***For landing distance at or below 8000 ft pressure altitude, apply the STD adjustment. For altitudes higher than 8000 ft, first apply the STD adjustment to derive a new reference landing distance for 8000 ft then apply the HIGH adjustment to this new reference distance.**

Reference distance is based on sea level, standard day, no wind or slope, VREF30, two-engine detent No. 2 reverse thrust, and auto speedbrakes.
For max manual braking and manual speedbrakes, increase reference landing distance by 170 ft.
For autobrake and manual speedbrakes, increase reference landing distance by 150 ft.
Reference Distance includes an air distance allowance of 1000 ft from threshold to touchdown.
Actual (unfactored) distances are shown.

***For landing distance at or below 8000 ft pressure altitude, apply the STD adjustment. For altitudes higher than 8000 ft, first apply the STD adjustment to derive a new reference landing distance for 8000 ft then apply the HIGH adjustment to this new reference distance.**

AUTOBRAKE MAX	Autobrake Inoperative								
AUTOBRAKE 3	Autobrake Inoperative								

Reference distance is based on sea level, standard day, no wind or slope, and maximum available reverse thrust.
MAX MANUAL assumes maximum achievable manual braking.
Reference Distance includes an air distance allowance of 1000 ft from threshold to touchdown.
Actual (unfactored) distances are shown.

***For landing distance at or below 8000 ft pressure altitude, apply the STD adjustment. For altitudes higher than 8000 ft, first apply the STD adjustment to derive a new reference landing distance for 8000 ft then apply the HIGH adjustment to this new reference distance.**

Reference Distance includes an air distance allowance of 1000 ft from threshold to touchdown.
Actual (unfactored) distances are shown.

***For landing distance at or below 8000 ft pressure altitude, apply the STD adjustment. For altitudes higher than 8000 ft, first apply the STD adjustment to derive a new reference landing distance for 8000 ft then apply the HIGH adjustment to this new reference distance.**

ADVISORY INFORMATION

Observe maximum quick turnaround limit.
Table shows energy per brake added by a single stop with all brakes operating. Energy is assumed to be equally distributed among the operating brakes. Total energy is the sum of residual energy plus energy added.
Add 1.0 million foot pounds per brake for each taxi mile.

When in caution zone, wheel fuse plugs may melt. Delay takeoff and inspect after one hour. If overheat occurs after takeoff, extend gear soon for at least 7 minutes.

When in fuse plug melt zone, clear runway immediately. Unless required, do not set parking brake. Do not approach gear or attempt to taxi for one hour. Tire, wheel and brake replacement may be required. If overheat occurs after takeoff, extend gear soon for at least 12 minutes.

Brake temperature monitor system (BTMS) indication on CDS systems page may be used 10 to 15 minutes after airplane has come to a complete stop or inflight with gear retracted to determine recommended cooling schedule.

Performance Inflight — Chapter PI
Text — Section 26

Introduction

This chapter contains information to supplement performance data from the Flight Management Computer (FMC). In addition, sufficient inflight data is provided to complete a flight with the FMC inoperative. In the event of conflict between data presented in this chapter and that contained in the approved Airplane Flight Manual, the Flight Manual shall always take precedence.

General

Takeoff Speeds

The speeds presented in the Takeoff Speeds table as well as FMC computed takeoff speeds can be used for all performance conditions except where adjustments must be made for anti-skid inoperative, thrust reversers inoperative, improved climb, contaminated runway situations, or brake energy limits.

V1 adjustments are not necessary for equal amounts of clearway and stopway. V1 for takeoff limit weights based on unequal clearway and stopway should be obtained from computerized takeoff speeds calculations for the specific takeoff conditions.

These speeds may be used for weights less than or equal to the performance limited weight subject to the restrictions noted above.

The FMC will protect for minimum control speeds by increasing V1, VR and V2 as required. However, the FMC will not compute takeoff speeds for weights where the required speed increase exceeds the maximum certified speed increase. This typically occurs at full rated thrust and light weights. In this case, the message "V SPEEDS UNAVAILABLE" will appear on the FMC scratchpad and the takeoff speed entries will be blank. In this situation, manually verify takeoff speeds using an approved source of takeoff performance information. Upon verifying the takeoff speeds, takeoff is permitted. When selected takeoff speeds cannot be verified, the options are to select a lower number flap setting, select derate thrust and/or increase airplane gross weight (e.g. add fuel). Selecting derate thrust is the preferred method as this will reduce the minimum control speeds. Note that the assumed temperature method will not help this condition as the minimum control speeds are determined at the actual temperature and therefore are not reduced by an assumed temperature selection.

Normal takeoff speeds, V1, VR, and V2 are read from either the dry or wet table by entering with takeoff flap setting and brake release weight. Use the tables provided to adjust takeoff speeds for altitude and actual temperature or assumed temperature for reduced thrust takeoffs. Slope and wind adjustments to V1 are obtained by entering the Slope and Wind V1 Adjustment table.

V1(MCG)

Regulations prohibit scheduling takeoff with a V1 less than minimum V1 for control on the ground, V1(MCG). It is therefore necessary to compare the adjusted V1 to V1(MCG). The V1(MCG) presented in this manual is conservative for all weight and bleed configurations.

To find V1(MCG) enter the V1(MCG) table with the airport pressure altitude and actual OAT. If the adjusted V1 is less than V1(MCG), set V1 equal to V1(MCG). If the adjusted VR is less than V1(MCG), set VR equal to V1(MCG), and determine a new V2 by adding the difference between the normal VR and V1(MCG) to the normal V2. No takeoff weight adjustment is necessary provided that the actual field length exceeds the minimum field length shown in the Field and Climb Limit Weight table in chapter Performance Dispatch.

Stab Trim

To find takeoff stabilizer trim setting, enter Stab Trim Setting table with anticipated brake release weight and center of gravity (C.G. % MAC) and read required stabilizer trim units.

VREF

This table contains flaps 40, 30 and 15 reference speeds for a given weight.

Flap Maneuver Speeds

This table provides flap maneuver speeds for various flap settings. During flap retraction, selection of the next flap position is initiated when reaching the maneuver speed for the existing flap position. During flap retraction, at least adequate maneuver capability or 30° of bank (15° of bank and 15° overshoot) to stick shaker is provided at the flap retraction speed. Full maneuver capability or at least 40° of bank (25° of bank and 15° overshoot) is provided when the airplane has accelerated to the recommended maneuver speed for the selected flap position.

During flap extension, selection of the flaps to the next flap position should be made when approaching, and before decelerating below, the maneuver speed for the existing flap position. The flap extension speed schedule varies with airplane weight and provides full maneuver capability or at least 40° of bank (25° of bank and 15° overshoot) to stick shaker at all weights.

Slush/Standing Water Takeoff

Experience has shown that aircraft performance may deteriorate significantly on runways covered with snow, slush, standing water or ice. Therefore, reductions in field/obstacle limited takeoff weight and revised takeoff speeds are necessary. The tables are intended for guidance in accordance with advisory material and assume an engine failure at the critical point during the takeoff.

The entire runway is assumed to be completely covered by a contaminant of uniform thickness and density. Therefore this information is conservative when operating under typical cold weather conditions where patches of slush exist and some degree of sanding is common. Takeoffs in slush or standing water depths greater than 0.5 inches (13 mm) are not recommended because of possible airplane damage as a result of spray impingement on the airplane structure. The use of assumed temperature for reduced thrust is not allowed on contaminated runways. Interpolation for slush/standing water depths between the values shown is permitted.

Takeoff weight determination:

1. Enter the Weight Adjustment table with the dry field/obstacle limit weight to obtain the weight reduction for the slush/standing water depth and airport pressure altitude.
2. Adjust field length available for temperature by amount shown beneath V1(MCG) limit weight table.
3. Enter the V1(MCG) Limit Weight table with the adjusted field length and pressure altitude to obtain the slush/standing water limit weight with respect to minimum field length required for V1(MCG) speed.
4. The maximum allowable takeoff weight in slush/standing water is the lesser of the limit weights found in steps 1 and 3.

Takeoff speed determination:

1. Determine takeoff speeds V1, VR and V2 for actual brake release weight using the Dry Runway Takeoff Speeds table for the appropriate flap setting and thrust rating.
2. If V1(MCG) limited, set V1=V1(MCG). If not limited by V1(MCG) considerations, enter the V1 Adjustment table with actual brake release weight to determine the V1 reduction to apply to V1 speed. If the adjusted V1 is less than V1(MCG), set V1=V1(MCG).

Slippery Runway Takeoff

Airplane braking action is reported as good, medium or poor, depending on existing runway conditions. If braking action is reported as good, conditions should not be expected to be as good as on clean, dry runways. The value “good” is comparative and is intended to mean that airplanes should not experience braking or directional control difficulties when stopping. The performance level used to calculate the “good” data is consistent with wet runway testing done on early Boeing jets. The performance level used to calculate the “poor” data reflects a runway covered with wet ice. Performance is based on a 15 ft screen height at the end of the runway. The tables provided are used in the same manner as the Slush/Standing Water tables.

Anti-Skid Inoperative

When operating with anti-skid inoperative, the field limit weight and V1 must be reduced to account for the effect on accelerate-stop performance. Anti-skid inoperative is only allowed on a dry runway. A simplified method which conservatively accounts for the effects of anti-skid inoperative is to reduce the normal dry field/obstacle limited weight by 18300 lb and the V1 associated with the reduced weight by the amount shown in the table below.

ANTI-SKID INOPERATIVE V1 ADJUSTMENTS	
FIELD LENGTH (FT)	V1 ADJUSTMENT (KIAS)
6000	-18
8000	-15
10000	-12
12000	-10
14000	-9

If the resulting V1 is less than V1(MCG), takeoff is permitted with V1 set equal to V1(MCG) provided the dry accelerate-stop distance adjusted for wind and slope exceeds approximately 7300 ft.

Detailed analysis for the specific case from the Airplane Flight Manual may yield a less restrictive penalty.

Thrust Reverser Inoperative

When dispatching on a wet runway with both thrust reversers operative, an operative anti-skid system, and all brakes operating, regulations allow deceleration credit for one thrust reverser in the engine failure case and two thrust reversers in the all engine stop case.

When dispatching on a wet runway with one thrust reverser inoperative, the field/obstacle limited weight and V1 speed must be reduced to account for the effect on accelerate-stop performance. A simplified method, which conservatively accounts for this, is to reduce the normal wet runway/field/obstacle limited weight by 2200 lb and the V1 associated with the reduced weight by 2 knots.

If the resulting V1 is less than minimum V1, takeoff is permitted with V1 set equal to V1(MCG) provided the accelerate-stop distance available adjusted for wind and slope exceeds approximately 5200 ft.

Detailed analysis for the specific case from the Airplane Flight Manual may yield a less restrictive penalty.

Takeoff %N1

To find Max Takeoff %N1 based on normal engine bleed for air conditioning packs on, enter Takeoff %N1 Table with airport pressure altitude and airport OAT and read %N1. Apply %N1 adjustments as provided when applicable.

Assumed Temperature Reduced Thrust

Regulations permit the use of up to 25% takeoff thrust reduction for operation with assumed temperature reduced thrust. Use of assumed temperature reduced thrust is not allowed with anti-skid inoperative or on runways contaminated with standing water, ice, slush, or snow. Use of assumed temperature reduced thrust is not recommended if potential windshear conditions exist.

To find the maximum allowable assumed temperature enter the Maximum Assumed Temperature table with airport pressure altitude and OAT. Compare this temperature to that at which the airplane is performance limited as determined from available takeoff performance data. Next, enter the Maximum Takeoff %N1 table with airport pressure altitude and the lower of the two temperatures previously determined, to obtain a maximum takeoff %N1. Do not use an assumed temperature less than the minimum assumed temperature shown. Enter the %N1 Adjustment table with OAT and the difference between the assumed and actual OAT to obtain a %N1 adjustment. Subtract the %N1 adjustment from the maximum takeoff %N1 found previously to determine the assumed temperature reduced thrust %N1.

Apply %N1 adjustments as provided when applicable.

Max Climb %N1

This table shows Max Climb %N1 for a 280/.78 climb speed schedule, normal engine bleed for packs on or off and anti-ice off. Enter the table with airport pressure altitude and TAT and read %N1. %N1 adjustments are shown for anti-ice operation.

Go-around %N1

To find Max Go-around %N1 based on normal engine bleed for packs on (AUTO) and anti-ice on or off, enter the Go-around %N1 table with airport pressure altitude and reported OAT or TAT and read %N1. For packs OFF or HIGH operation, apply the %N1 adjustment shown below the table.

Flight with Unreliable Airspeed / Turbulent Air Penetration

Pitch attitude and average %N1 information is provided for use in all phases of flight in the event of unreliable airspeed/Mach indications resulting from blocking or freezing of the pitot system. Loss of radome or turbulent air may also cause unreliable airspeed/Mach indications. The cruise table in this section may also be used for turbulent air penetration. The Flight with Unreliable Airspeed - FINAL APPROACH table includes a 10 knot margin for landing.

Pitch attitude is shown in bold type for emphasis since altitude and/or vertical speed indications may also be unreliable.

All Engines

Long Range Cruise Maximum Operating Altitude

These tables provide the maximum operating altitude in the same manner as the FMC. Maximum altitudes are shown for a given cruise weight and maneuver capability. This table considers both thrust and buffet limits, providing the more limiting of the two. Any data that is thrust limited is denoted by an asterisk and represents only a thrust limited condition in level flight with 100 ft/min residual rate of climb. Flying above these altitudes with sustained banks in excess of approximately 15° may cause the airplane to lose speed and/or altitude. The altitudes shown in the table are limited to the maximum certified altitude of 41000 ft.

Long Range Cruise Control

These tables provide target %N1, Long Range Cruise Mach number, IAS and standard day fuel flow per engine for the airplane weight and pressure altitude. As indicated by the shaded area, at optimum altitude .79M approximates the Long Range Cruise Mach schedule.

Long Range Cruise Enroute Fuel and Time

Long Range Cruise Enroute Fuel and Time tables are provided to determine remaining time and fuel required to destination. The data is based on Long Range Cruise and .78/280/250 descent. Tables are presented for low altitudes and high altitudes.

To determine remaining fuel and time required, first enter the Ground to Air Miles Conversion table to convert ground distance and enroute wind to an equivalent still air distance for use with the Reference Fuel and Time tables. Next, enter the Reference Fuel and Time table with air distance from the Ground to Air Miles Conversion table and the desired altitude and read Reference Fuel and Time Required. Lastly, enter the Fuel Required Adjustment table with the Reference Fuel and the actual weight at checkpoint to obtain fuel required to destination.

APU Operation During Flight

For APU operation during flight, increase fuel flow according to the table in the Engine Inoperative text section.

Long Range Cruise Wind-Altitude Trade

Wind is a factor which may justify operations considerably below optimum altitude. For example, a favorable wind component may have an effect on ground speed which more than compensates for the loss in air range.

Using this table, it is possible to determine the break-even wind (advantage necessary or disadvantage that can be tolerated) to maintain the same range at another altitude and long range cruise speed. The tables make no allowance for climb or descent time, fuel or distance, and are based on comparing ground fuel mileage.

Descent

Time, fuel, and distance for descent are shown for a .78/280/250 descent speed schedule. Enter the table with top of descent pressure altitude and read distance, time and fuel. Data is based on flight idle thrust descent in zero wind. Allowances are included for a straight-in approach with gear down and landing flaps at the outer marker.

Holding

Target %N1, indicated airspeed and fuel flow per engine information is tabulated for holding with flaps up based on the FMC optimum holding speed schedule. This is the higher of the maximum endurance speed and the maneuvering speed. Small variations in airspeed will not appreciably affect the overall endurance time. Enter the table with weight and pressure altitude to read %N1, IAS and fuel flow per engine.

Advisory Information

Normal Configuration Landing Distance

The normal configuration distance tables are provided as advisory information to help determine the actual landing distance performance of the airplane for different runway surface conditions and brake configurations.

Flaps 15, 30, and 40 landing distances and adjustments are provided for dry runways as well as runways with good, medium, and poor reported braking action, which are commonly referred to as slippery runway conditions.

If the surface is affected by water, snow or ice, and the braking action is reported as "good", conditions should not be expected to be as good as on clean, dry runways. The value "good" is comparative and is intended to mean that airplanes should not experience braking or directional control difficulties when landing. The performance level used to calculate the "good" data is consistent with wet runway testing done on early Boeing jets. The performance level used to calculate "poor" data reflects runways covered with wet ice.

Dry runway landing performance is shown for max manual braking configuration and autobrake settings max, 3, 2, and 1. The autobrake performance may be used to assist in the selection of the most desirable autobrake setting for a given field length. Selection of an autobrake setting results in a constant rate of deceleration. Maximum effort manual braking should achieve shorter landing distance than the max autobrake setting. The reference landing distance is a reference distance from 50 ft above the threshold to stop based on a reference landing weight and normal approach speed for the selected landing flap at sea level, zero wind, zero slope, and two engine detent reverse thrust. Subsequent columns provide adjustments for off-reference landing weight, altitude, wind, slope, temperature, speed, and reverse thrust. Each adjustment is independently added to the reference landing distance.

Non-normal Configuration Landing Distance

Advisory information is provided to support non-normal configurations that affect the landing performance of the airplane. Landing distances and adjustments are provided for dry runways and runways with good, medium, and poor reported braking action.

Enter the table with the applicable non-normal configuration and read the normal approach speed. The reference landing distance is a reference distance from 50 ft above the threshold to stop based on a reference landing weight and speed at sea level, zero wind, and zero slope. Subsequent columns provide adjustments for off-reference landing weight, altitude, wind, slope, and speed conditions. Each adjustment is independently added to the reference landing distance. Landing distance includes the effect of reverse thrust.

Recommended Brake Cooling Schedule

Advisory information is provided to assist in avoiding the problems associated with hot brakes. For normal operation, most landings are at weights below the AFM quick turnaround limit weight.

Use of the recommended cooling schedule will help avoid brake overheat and fuse plug problems that could result from repeated landings at short time intervals or a rejected takeoff.

Enter the Recommended Brake Cooling Schedule table with the airplane weight and brakes on speed, adjusted for wind at the appropriate temperature and altitude condition. Instructions for applying wind adjustments are included below the table. Linear interpolation may be used to obtain intermediate values. The resulting number is the reference brake energy per brake in millions of foot-pounds, and represents the amount of energy absorbed by each brake during a rejected takeoff. Notes providing adjustments for wind are included below the table.

To determine the energy per brake absorbed during landing, enter the appropriate Adjusted Brake Energy Per Brake table (No Reverse Thrust or 2 Engine Reverse) with the reference brake energy per brake and the type of braking used during landing (Max Manual, Max Auto, or Autobrake). The resulting number is the adjusted brake energy per brake and represents the energy absorbed in each brake during the landing.

The recommended cooling time is found in the appropriate (steel or carbon brakes) final table by entering with the adjusted brake energy per brake. Times are provided for ground cooling and inflight gear down cooling.

Brake Temperature Monitor System (BTMS) indications are also shown. If brake cooling is determined from the BTMS, use the hottest brake indication 10 to 15 minutes after the airplane has come to a complete stop, or inflight with gear retracted to determine recommended cooling schedule.

Engine Inoperative

Initial Max Continuous %N1

The Initial Max Continuous %N1 setting for use following an engine failure is shown. The table is based on the typical all engine cruise speed of .79M to provide a target %N1 setting at the start of driftdown. Once driftdown is established, the Max Continuous %N1 table should be used to determine %N1 for the given conditions.

Max Continuous %N1

Power setting is based on one engine operating with one A/C pack operating and all anti-ice bleeds off. Enter the table with pressure altitude, TAT, and IAS or Mach to read %N1.

It is desirable to maintain engine thrust level within the limits of the Max Cruise thrust rating. However, where thrust level in excess of Max Cruise rating is required, such as for meeting terrain clearance, ATC altitude assignments, or to attain maximum range capability, it is permissible to use the thrust needed up to the Max Continuous thrust rating. The Max Continuous thrust rating is intended primarily for emergency use at the discretion of the pilot and is the maximum thrust that may be used continuously.

Driftdown Speed/Level Off Altitude

The table shows optimum driftdown speed as a function of cruise weight at start of driftdown. Also shown are the approximate weight and pressure altitude at which the airplane will level off considering 100 ft/min residual rate of climb.

The level off altitude is dependent on air temperature (ISA deviation).

Driftdown/LRC Range Capability

This table shows the range capability from the start of driftdown. Driftdown is continued to level off altitude. As weight decreases due to fuel burn, the airplane is accelerated to Long Range Cruise speed. Cruise is continued at level off altitude and Long Range Cruise speed.

To determine fuel required, enter the Ground to Air Miles Conversion table with the desired ground distance and adjust for anticipated winds to obtain air distance to destination. Then enter the Driftdown/Cruise Fuel and Time table with air distance and weight at start of driftdown to determine fuel and time required. If altitudes other than the level off altitude is used, fuel and time required may be obtained by using the Engine Inoperative Long Range Cruise Enroute Fuel and Time table.

Long Range Cruise Altitude Capability

The table shows the maximum altitude that can be maintained at a given weight and air temperature (ISA deviation), based on Long Range Cruise speed, Max Continuous thrust, and 100 ft/min residual rate of climb.

Long Range Cruise Control

The table provides target %N1, engine inoperative Long Range Cruise Mach number, IAS and fuel flow for the airplane weight and pressure altitude. The fuel flow values in this table reflect single engine fuel burn.

APU Operation During Flight

For APU operation during flight, increase fuel flow according to the following table. These increments include the APU fuel flow and the effect of increased drag from the APU door.

PRESSURE ALTITUDE (1000 FT)	APU FUEL FLOW (LB/HR)
39	100
35	100
31	110
25	130
20	150
15	160
10	180
5	200

Long Range Cruise Diversion Fuel and Time

Tables are provided for crews to determine the fuel and time required to proceed to an alternate airfield with one engine inoperative. The data is based on single engine Long Range Cruise speed and .78/280/250 descent. Enter with Air Distance as determined from the Ground to Air Miles Conversion table and read Fuel and Time required at the cruise pressure altitude. Adjust the fuel obtained for deviation from the reference weight at checkpoint as required by entering the off reference fuel adjustments table with the fuel required for the reference weight and the actual weight at checkpoint. Read fuel required and time for the actual weight.

Holding

Single engine holding data is provided in the same format as the all engine holding data and is based on the same assumptions.

Gear Down Landing Rate of Climb Available

Rate of climb data is provided as guidance information in the event an engine inoperative landing (manual or autoland) is planned. The tables show gear down rate of climb available for Flaps 15 and Flaps 30. Enter the table with TAT and pressure altitude to read rate of climb available. Apply adjustments shown to correct for weight.

Alternate Mode EEC

Introduction

No takeoff speed adjustments or other performance adjustments are required of Electronic Engine Control (EEC) in the alternate mode (ALTN EEC switch illuminated) for the 7B18, -7B20, -7B22, -7B24 and -7B24A engine thrust ratings.

Operation with derate and/or assumed temperature reduced thrust is not permitted with the EEC in alternate mode.

Gear Down

This section contains performance for airplane operation with the landing gear extended. The data is based on engine bleeds for normal air conditioning.

Note: The Flight Management Computer System (FMCS) does not contain special provisions for operation with landing gear extended. As a result, the FMCS may generate inappropriate enroute speed schedules, display non-conservative predictions of fuel burn, estimated time of arrival (ETA), maximum altitude, and compute overly shallow descent path. An accurate estimated time of arrival (ETA) is available if current speed or Mach is entered into the VNAV cruise page.

Tables for gear down performance in this section are identical in format and used in the same manner as tables for the gear up configuration previously described.

General

The table below shows the airplanes that have been identified with the following performance package. Note, some airplanes may be identified with more than one performance package. This configuration table information reflects the Boeing delivered configuration updated for service bulletin incorporations in conformance with the policy stated in the introduction section of the FCOM. The performance data is prepared for the owner/operator named on the title page. The intent of this information is to assist flight crews and airlines in knowing which performance package is applicable to a given airplane. The performance package model identification information is based on Boeing's knowledge of the airline's fleet at a point in time approximately three months prior to the page date. Notice of Errata (NOE) will not be provided to airlines to identify airplanes that are moved between performance packages within this manual or airplanes added to the airline's fleet whose performance packages are already represented in this manual. These types of changes will be updated in the next block revision. Owners/operators are responsible for ensuring the operational documentation they are using is complete and matches the current configuration of their airplanes, and the accuracy and validity of all information furnished by the owner/operator or any other party. Owners/operators receiving active revision service are responsible to ensure that any modifications to the listed airplanes are properly reflected in this manual.

Serial and tabulation number are supplied by Boeing.

1. **Enter Weight Adjustment table with reported braking action and dry field/obstacle limit weight to obtain slippery runway weight adjustment.**
2. **Adjust "Good" field length available by -45 m/+45 m for every 5°C above/below 4°C.
Adjust "Medium" field length available by -45 m/+45 m for every 5°C above/below 4°C.
Adjust "Poor" field length available by -65 m/+65 m for every 5°C above/below 4°C.**
3. **Find V1(MCG) limit weight for adjusted field length and pressure altitude.**
4. **Max allowable slippery runway limited weight is lesser of weights from 1 and 3.**

ADVISORY INFORMATION

Slippery Runway Takeoff
No Reverse Thrust

1. **Obtain V1, VR and V2 for the actual weight using the Dry Runway Takeoff Speeds table.**
2. **If V1(MCG) limited, set V1 = V1(MCG). If not V1(MCG) limited, enter V1 Adjustment table with the actual weight to obtain V1 speed adjustment. If adjusted V1 is less than V1(MCG), set V1 = V1(MCG). V1 not to exceed VR.**

1. **Determine Maximum Assumed Temperature allowed from Table 1.**
2. **Find Maximum %N1 from Table 2 using the desired assumed temperature (no greater than temperature from Table 1).**
3. **Use the difference between assumed temperature and OAT to determine the %N1 adjustment from Table 3.**
4. **Subtract %N1 adjustment from Maximum %N1 in Table 2.**

1. **Enter Weight Adjustment table with reported braking action and 24K Derate dry field/obstacle limit weight to obtain slippery runway weight adjustment.**
2. **Adjust "Good" field length available by -30 m/+25 m for every 5°C above/below 4°C.**
   Adjust "Medium" field length available by -30 m/+25 m for every 5°C above/below 4°C.
   Adjust "Poor" field length available by -45 m/+40 m for every 5°C above/below 4°C.
3. **Find V1(MCG) limit weight for adjusted field length and pressure altitude.**
4. **Max allowable slippery runway limited weight is lesser of weights from 1 and 3.**

1. **Enter Weight Adjustment table with slush/standing water depth and 22K Derate dry field/obstacle limit weight to obtain slush/standing water weight adjustment.**
2. **Adjust field length available by -55 m/+55 m for every 5°C above/below 4°C.**
3. **Find V1(MCG) limit weight for adjusted field length and pressure altitude.**
4. **Max allowable slush/standing water limited weight is lesser of weights from 1 and 3.**

1. **Determine Maximum Assumed Temperature allowed from Table 1.**
2. **Find Maximum %N1 from Table 2 using the desired assumed temperature (no greater than temperature from Table 1).**
3. **Use the difference between assumed temperature and OAT to determine the %N1 adjustment from Table 3.**
4. **Subtract %N1 adjustment from Maximum %N1 in Table 2.**

Max Climb %N1

Based on engine bleed for packs on or off and anti-ice off

Only authorized operators may use Flaps 5 for a Go-Around in conjunction with the Alternate Go-Around and Missed Approach Procedure.

Flight With Unreliable Airspeed/Turbulent Air Penetration

Altitude and/or vertical speed indications may also be unreliable.

GO-AROUND

25	35	45	55	65	75	84	92	99	104

The above wind factor table is for calculation of wind required to maintain present range capability at new pressure altitude, i.e., break-even wind.

Method:

1. **Read wind factors for present and new altitudes from table.**
2. **Determine difference (new altitude wind factor minus present altitude wind factor); This difference may be negative or positive.**
3. **Break-even wind at new altitude is present altitude wind plus difference from step 2.**

AUTOBRAKE 1	2655	195/-200	85/120	-160/605	190/-130	70/-75	100	380	925

Reference distance is based on sea level, standard day, no wind or slope, VREF30, two-engine detent No. 2 reverse thrust, and auto speedbrakes.
For max manual braking and manual speedbrakes, increase reference landing distance by 60 m.
For autobrake and manual speedbrakes, increase reference landing distance by 50 m.
Reference Distance includes an air distance allowance of 305 m from threshold to touchdown.
All reference distances and adjustments shown have been increased by 15%.

***For landing distance at or below 8000 ft pressure altitude, apply the STD adjustment. For altitudes higher than 8000 ft, first apply the STD adjustment to derive a new reference landing distance for 8000 ft then apply the HIGH adjustment to this new reference distance.**

AUTOBRAKE 3	2320	170/-170	75/110	-135/510	175/-105	60/-65	N/A	440	1250

Reference distance is based on sea level, standard day, no wind or slope, and maximum available reverse thrust.
MAX MANUAL assumes maximum achievable manual braking.
Reference Distance includes an air distance allowance of 305 m from threshold to touchdown.
